

# Coherent spatial database for the EU-WATERRES platform

December 2023

The project No.2018-1-0137 “EU-WATERRES: EU-integrated management system of cross-border groundwater resources and anthropogenic hazards” benefits from a € 2.447.761 grant from Iceland, Liechtenstein and Norway through the EEA and Norway Grants Fund for Regional Cooperation. The aim of the project is to promote coordinated management and integrated protection of transboundary groundwater by creating a geoinformation platform.

Technical information	
Document code:	WP4 – Reinforcement of the integrated use of data
Title of document:	Coherent spatial database for the EU-WATERRES platform
Reference activity:	Output 6. Coherent spatial database for the EU-WATERRES platform
Dissemination level:	Public
Version	1
Date	31.12.2023
Scientific Editor	Tatiana Solovey ( <i>Polish Geological Institute - National Research Institute</i> )
Authors ( <i>Polish Geological Institute –NRI</i> ):	Tetyana Solovey, Małgorzata Przychodzka, Hanna Kolos, Anna Krysa, Rafał Łusiak
Authors ( <i>Zahidukrgeologiya</i> ):	Dmytro Panov, Natalia Pavliuk, Svitlana Sokorenko, Liubov Yanush, Halyna Medvid
Authors ( <i>Ukrainian Geological Company</i> ):	Volodymyr Klos, Yurii Kharchyshyn
Authors ( <i>Latvian Environment, Geology and Meteorology Centre</i> ):	Dāvis Borzdins, Jekaterina Demidko, Krišjānis Valters
Authors ( <i>Geological Survey of Estonia</i> ):	Andres Marandi, Magdaleena Mannik, Marlen Hunt, Liina Hints
Authors ( <i>University of Latvia</i> ):	Jānis Bikše, Inga Retike
Authors ( <i>Norwegian Geological Survey</i> ):	
Authors ( <i>Norwegian Water Resources and Energy Directorate</i> ):	
Project coordinator	PGI-NRI
Document summary	
<p>This operating and functional manual has been developed with the aim of providing the MapPortal user with information about the operating principle of the created geoinformation platform, available functions, operations with the thematic layers and maps. The prepared information description was prepared separately for the Polish-Ukrainian and Estonian-Latvian pilot areas</p>	

The project No.2018-1-0137 "EU-WATERRES: EU-integrated management system of cross-border groundwater resources and anthropogenic hazards" benefits from a € 2.447.761 grant from Iceland, Liechtenstein and Norway through the EEA and Norway Grants Fund for Regional Cooperation.

Scientific work published as part of an international project co-financed by the program of the Minister of Science and Higher Education entitled "PMW" in the years 2020-2023; agreement No. 5152 / RF-COOPERATION / 2020/2.

## Preface

The purpose of this document is to deliver knowledge necessary to understand the capabilities of the EU-WATERRES geoportal and how it can be used. The portal was created for two pilot areas: Polish-Ukrainian and Estonian-Latvian as part of the project "EU-WATERRES "EU-integrated management system of cross-border groundwater resources and anthropogenic hazards"".

Here you can find information about the hydrogeological and geological structure of the pilot area, groundwater monitoring, environmental hazards, possible groundwater pollution, etc.

Using the tools and information of the geoportal, you can independently create and print hydrogeological and other thematic maps with the content you need, on a scale that meets your needs. The portal may be of interest to a specialist in the field of geology, an entrepreneur, a government official and a citizen.

## 1. General information

### 1.1. Data format

The portal displays images in PNG format sent by GeoServer via WMS services (and the background from the OSM service). The geoserver generates these images based on spatial data in the PostgreSQL database. The data for this database were imported from the received SHP files.

### 1.2. Coordinate system

Spatial data in the PostgreSQL database is in the WGS84 reference system. By default, the portal layout is set to EPSG 3857 (Pseudo-Mercator) so-called Google Mercator.

### 1.3. The spatial extent of the data

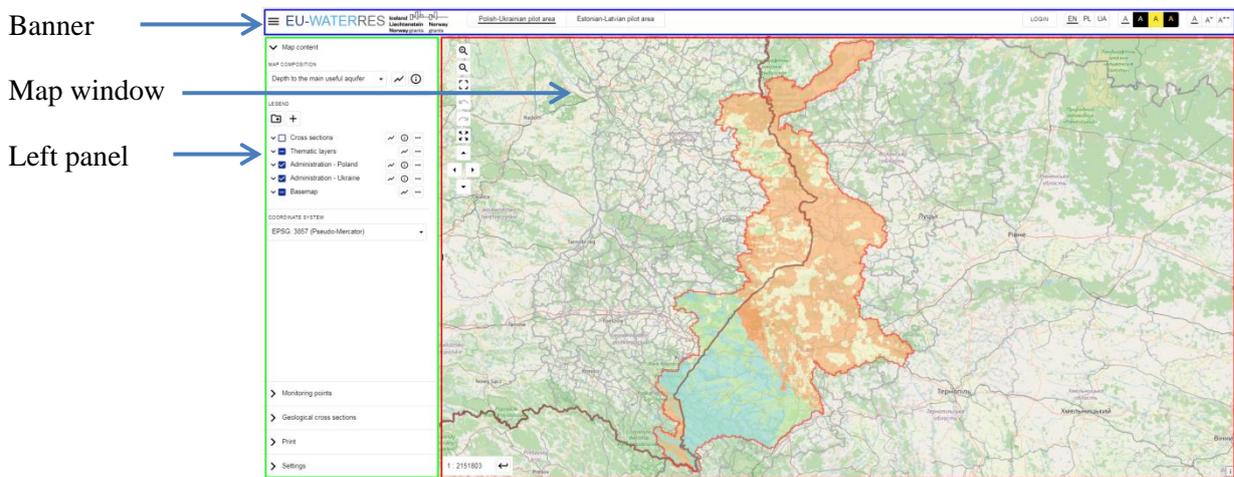

The area with the presented spatial data is located near the Polish-Ukrainian border in the south-eastern part of Poland and the north-western part of Ukraine, in the basin of the Bug, San and Dniester rivers. It covers an area of approximately 26 073 km<sup>2</sup>. Its geographical coordinates are:

Longitude from 44° 40' 74" E ; P =

Latitude from 50° 37' 06" N ; G =

## 2. Map view

### 2.1. Main parts of the map portal

*Main window of the portal*

### **Banner**

The menu groups tools for logging in, changing the language, choosing colors and font size.

In order for the data displayed on the map to be legible for the user, it is advisable to adjust the appearance of the application window to individual preferences using the available functions.

### Function buttons on the banner

Open/close left panel

EU-WATERRES

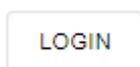

Click to go to the project page:  
- <https://eu-waterres.eu/>

Click to go to the fund page:  
- <https://eeagrants.org/>

Selection of Polish-Ukrainian or Estonian-Latvian pilot area.

Log in óredirects the user to the login page. Logging in takes place after entering the user's login and password.

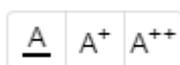

Selection of the language version of the portal: EN óEnglish, PL óPolish, UA óUkrainian English is selected by default.

### Features related to the accessibility of the map portal:

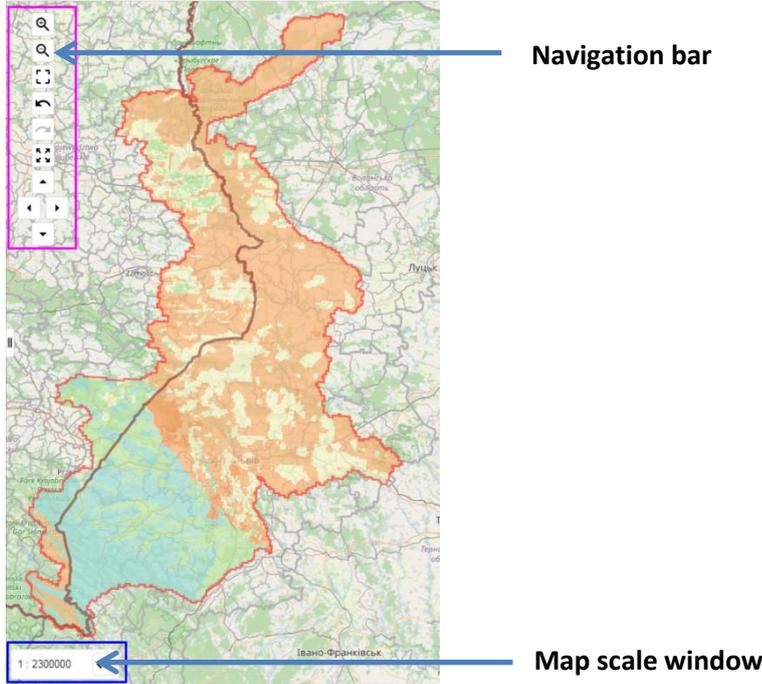

- Selection of high-contrast colors:
- The default colour scheme is *black letters on a white background*
  - Colour scheme *white letters on a black background*
  - Colour scheme *black letters on a yellow background*
  - Colour scheme *yellow letters on a black background*

- Font size selection buttons:
- medium
  - large
  - extra-large
- By default, the font size is set on medium.

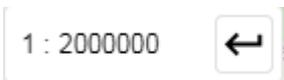

**Polish óUkrainian pilot area map window**

**Navigation bar**

		Zoom in (scroll the mouse wheel away from you)
		Zoom out (scroll the mouse wheel towards you)
	<p>The map can also be enlarged by double-clicking the left mouse button in the map window. Thus, the scale increases 2 times.</p>	
		A button that activates the function of enlarging the selected area on the map.
		<p>a) buton inactive b) buton active</p> <p>To activate it, click on the (a) button and then use the mouse cursor to highlight the area to be enlarged. Pressing this button (b) again will deactivate this function.</p>
	<p>Undo/Redo (preview). "Undo" button to restore the previous map scale. "Redo" button to repeat the scale of the map if canceled with the "Undo" button. If there have been no scale changes, the buttons are inactive (greyed out).</p>	
	<p>Reset zoom to default view. When you click this button, the map will be scaled to include the selected pilot area.</p>	
	<p>Navigation buttons right/left/up/down. When you press the button, the map moves in the specified direction.</p>	

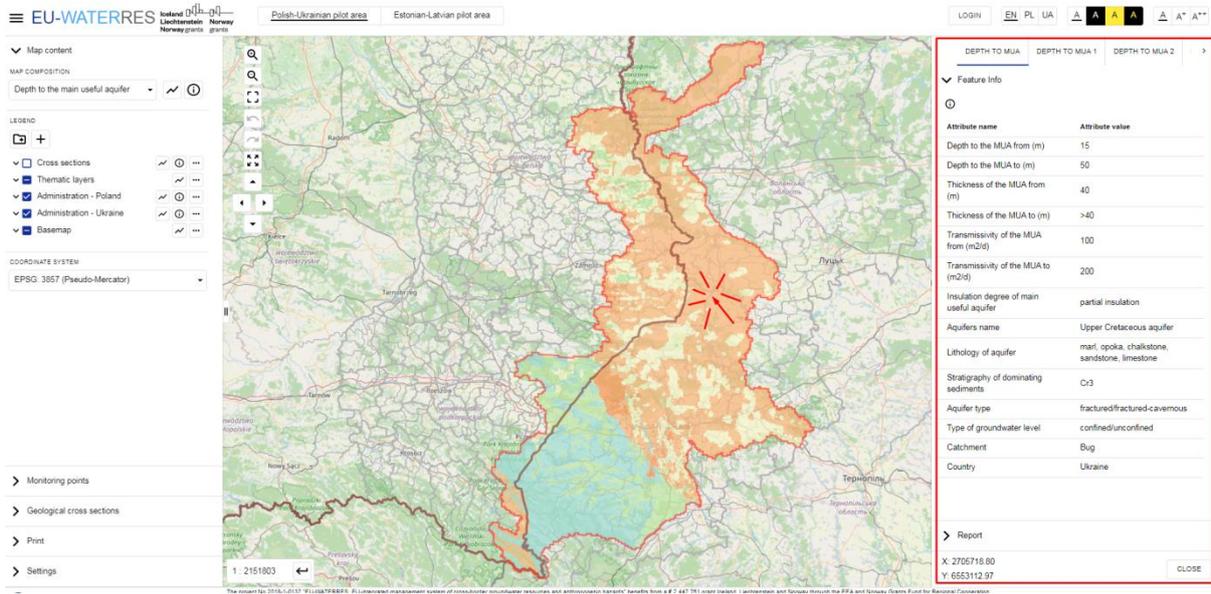

**Map scale window**

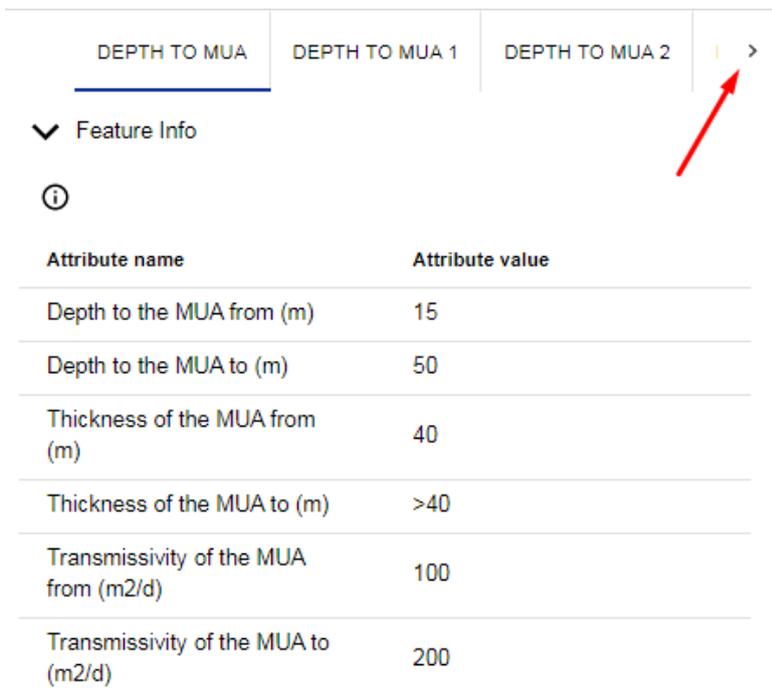

Map scale window. The number after the colon is the current map scale. You can set the scale you want. To do this, you need to write a scale and press enter or the button to the right of the numbers.

### Map window functionality

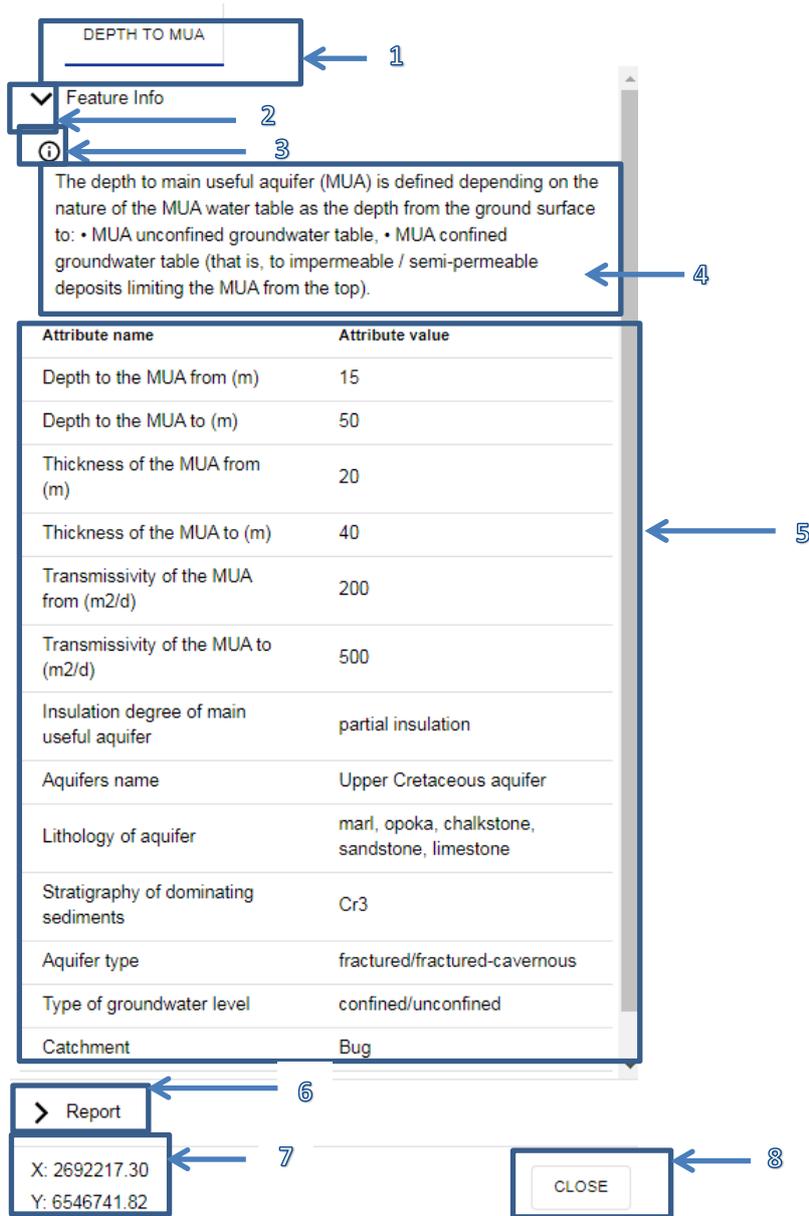

By clicking the mouse on the map, you can see the attributes of the object. To do this, click the left mouse button on the map object, and a window with information about the object will appear on the right side.

If there are several objects, you can view information about them all. You need to use the arrow and select the desired object for viewing.

**Feature info tab in the right panel**

- 1 ó Tabs with layer names
- 2 ó Show or hide "Feature info"
- 3 ó Show layer information
- 4 ó Layer description. Appears when clicked
- 5 ó Feature info
- 6 ó Report tab
- 7 ó The coordinates of where you clicked
- 8 ó "Close" button. Pressing will close the panel.

"Report" tab

> Feature Info

▼ Report

Description

GENERATE REPORT

- Description
- Feature Info

Selection of report elements.  
To activate/deactivate the required information in the generated report, check/uncheck the box.

GENERATE REPORT

"Generate report" button. Generates a file in \*.pdf format.

Create a report

The depth to main useful aquifer (MUA) is defined depending on the nature of the MUA water table as the depth from the ground surface to: • confined groundwater table (that is, to impermeable / semi-permeable deposits limiting the MUA from the top).

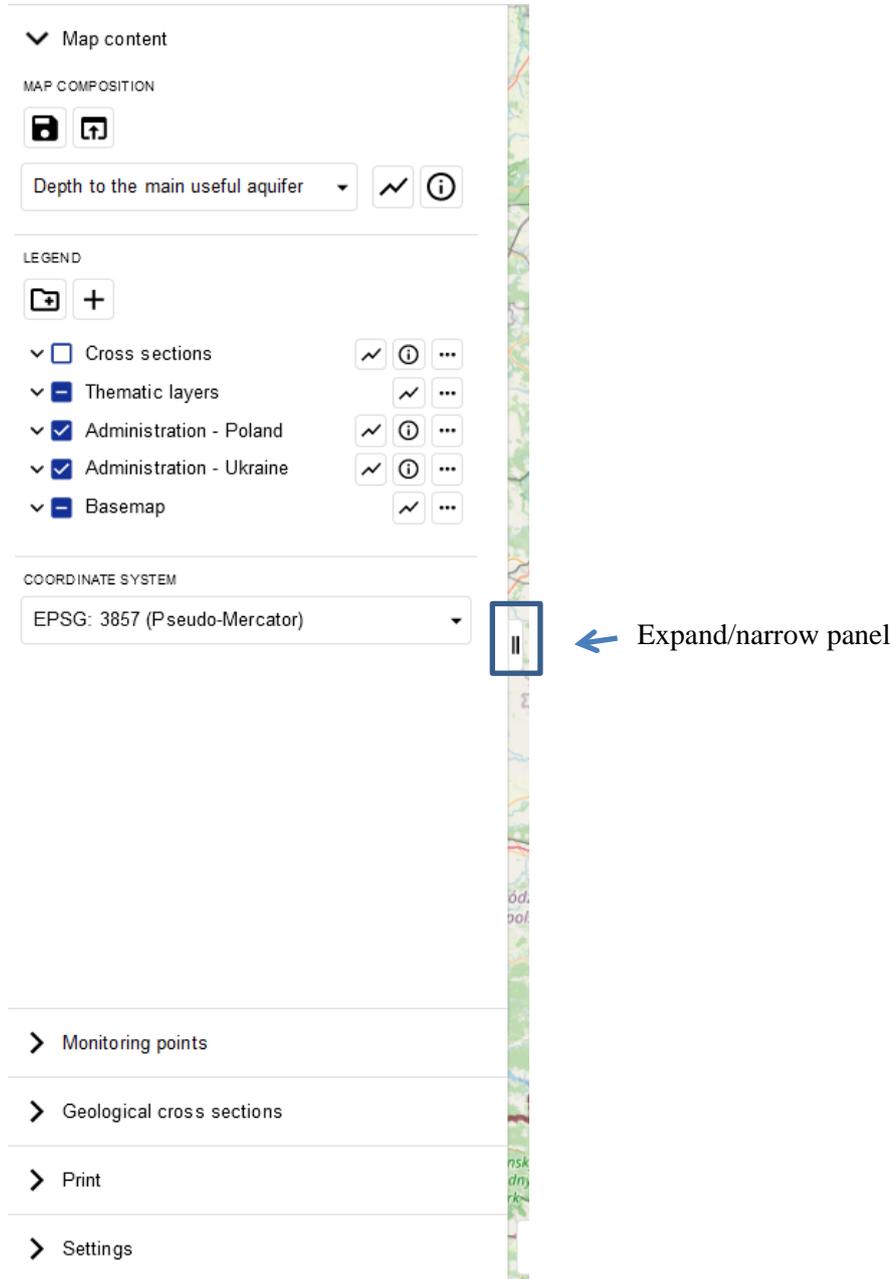

← Description

Attribute name	Attribute value
Depth to the MUA from (m)	15
Depth to the MUA to (m)	50
Thickness of the MUA from (m)	40
Thickness of the MUA to (m)	>40
Transmissivity of the MUA from (m <sup>2</sup> /d)	100
Transmissivity of the MUA to (m <sup>2</sup> /d)	200
Insulation degree of main useful aquifer	partial insulation
Aquifers name	Upper Cretaceous aquifer
Lithology of aquifer	marl, opoka, chalkstone, sandstone, limestone
Stratigraphy of dominating sediments	Cr3
Aquifer type	fractured/fractured-cavernous
Type of groundwater level	confined/unconfined
Catchment	Bug
Country	Ukraine

← Feature info

### Left panel

The sidebar tools allow you to create your own map layout that can be printed in a .pdf file. Using the button  on the banner, you can expand or collapse the side panel. If you hold and drag the button , you can expand or narrow the left pane while changing the width of the map window.

The screenshot shows a vertical sidebar on the left side of a map application. The sidebar is divided into several sections:

- Map content**
  - MAP COMPOSITION
    - Depth to the main useful aquifer (dropdown menu)
- LEGEND**
  - Cross sections (checkbox)
  - Thematic layers (checkbox)
  - Administration - Poland (checkbox, checked)
  - Administration - Ukraine (checkbox, checked)
  - Basemap (checkbox)
- COORDINATE SYSTEM**
  - EPSG: 3857 (Pseudo-Mercator) (dropdown menu)

At the bottom of the sidebar, there are four expandable menu items:

- Monitoring points
- Geological cross sections
- Print
- Settings

A blue box highlights a vertical double bar icon (||) on the right edge of the sidebar. A blue arrow points to this icon with the text "Expand/narrow panel".

The side panel menu consists of 5 items:

**Map content** óThe tab opens a menu with map content. The tool is used to manage the visibility of layers on the map, preview the markings applied to the map, and select the map's coordinate system.

**Monitoring point** óThe tab opens the menu with monitoring points. The tool allows you to turn on the visibility of selected or all monitoring points on the map, display their attributes and create reports and charts.

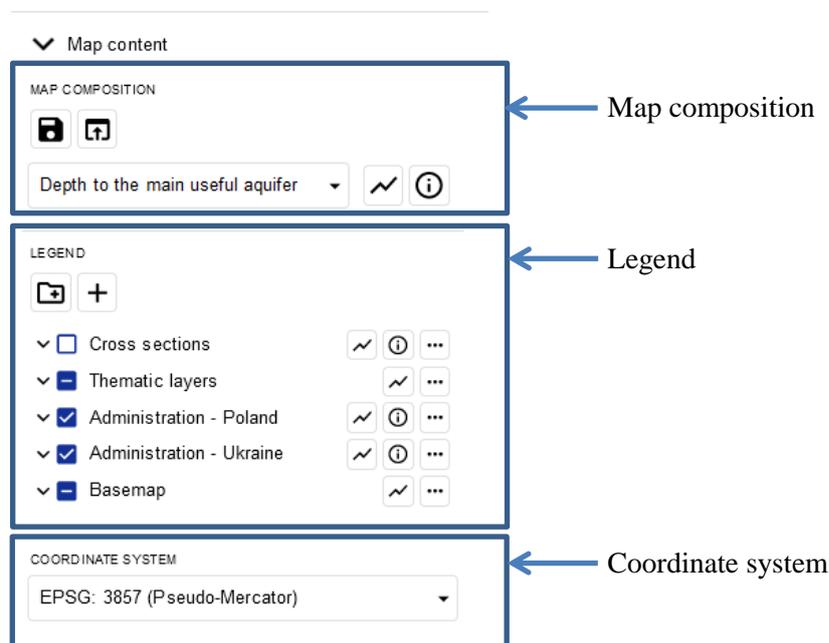

**Geological cross section** óThe tab opens a menu with geological cross-sections. The tool allows you to find a selected geological cross-section and display the attributes of the selected object.

**Print** óThe tab opens a menu with printing options. The tool is used to define print parameters of the created map composition.

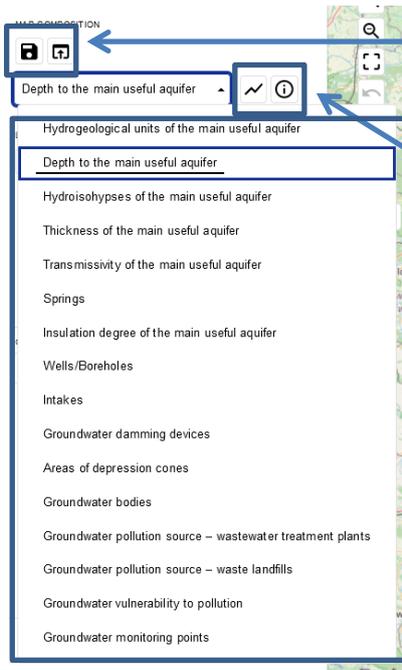

**Settings** óThe tab opens a menu with portal display settings. The tool allows you to set the diagonal of the used monitor and provides the current version of the application.

### Map content tab

Map content - the tool is used to manage the visibility of layers on the map, preview the markings used on the map, and select the map's coordinate system. It consists of three tabs: map composition, legend, coordinate system.

Allows you to select the layer that will be displayed in the map window.

Save the map composition

Open the map composition

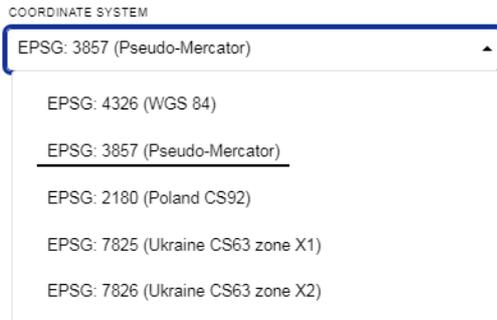

Show composition style - pressing the button displays a new window in the application with the symbols used on the map and their description.

Show information about the composition - pressing the button launches a window in which the definition of the selected layer is displayed.

You can select a thematic map to display from the drop-down list

### Coordinate system menu

In the tab, it is possible to select the coordinate system in which the map composition will be displayed.

To change the coordinate system, click on the field with the name of the default coordinate system. Then a list of coordinate systems appears, from which we select one from the list. When selected, the map composition will be displayed in the changed coordinate system.

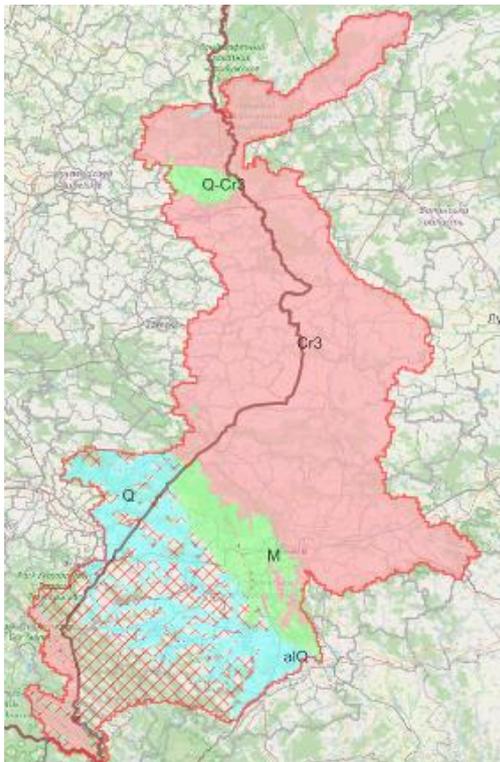

### 3. Map composition

The "Map composition" tab contains the following thematic layers:

- < Hydrogeological units of the main useful aquifer
- < Depth to the main useful aquifer
- < Hydroisohypses of the main useful aquifer
- < Thickness of the main useful aquifer
- < Transmissivity of the main useful aquifer
- < Springs
- < Insulation degree of the main useful aquifer
- < Wells / Boreholes
- < Intakes
- < Groundwater damming devices
- < Areas of depression cones
- < Groundwater bodies
- < Groundwater pollution source ówastewater treatment plants
- < Groundwater pollution source ówaste landfills
- < Groundwater vulnerability to pollution
- < Groundwater monitoring points

#### *3.1. Hydrogeological units of the main useful aquifer*

- < Map appearance

< Definition

An aquifer is a hydraulically continuous body of relatively permeable unconsolidated porous sediments or porous or fissured rocks containing groundwater. A useful aquifer is defined as an aquifer or group of aquifers showing good hydraulic connectivity, with the parameters of the quantity and quality of water qualifying for municipal use.

- < transmissivity > 50 m<sup>2</sup>/d,
- < total thickness M 5m (with an average state of retention),
- < shows a continuity of occurrence (with the accuracy of hydrogeological schematization appropriate for a map in the scale of 1: 50,000) in the area A>20 km<sup>2</sup> (in conditions of good identification and clear spatial differentiation of hydrogeological conditions, A>5 km<sup>2</sup> is allowed);
- < enable the execution of a drilled well with a recharge of over 5m<sup>3</sup>/h.

< Legend

The layer "Hydrogeological units of the main useful aquifer" is represented on the map by pixels with dimensions of 1000x1000 m filled with colors: pink, blue and green, which indicate hydrogeological units of the MUA: fissure, pore, pore and fissure, as well as areas where there are no MUA units filled with red grid.

-  Absence of MUA
-  Fractured
-  Porous
-  Porous and fractured

< Attributes

Below are the attributes and vocabularies used to describe the layer "hydrogeological units of the main useful aquifer":

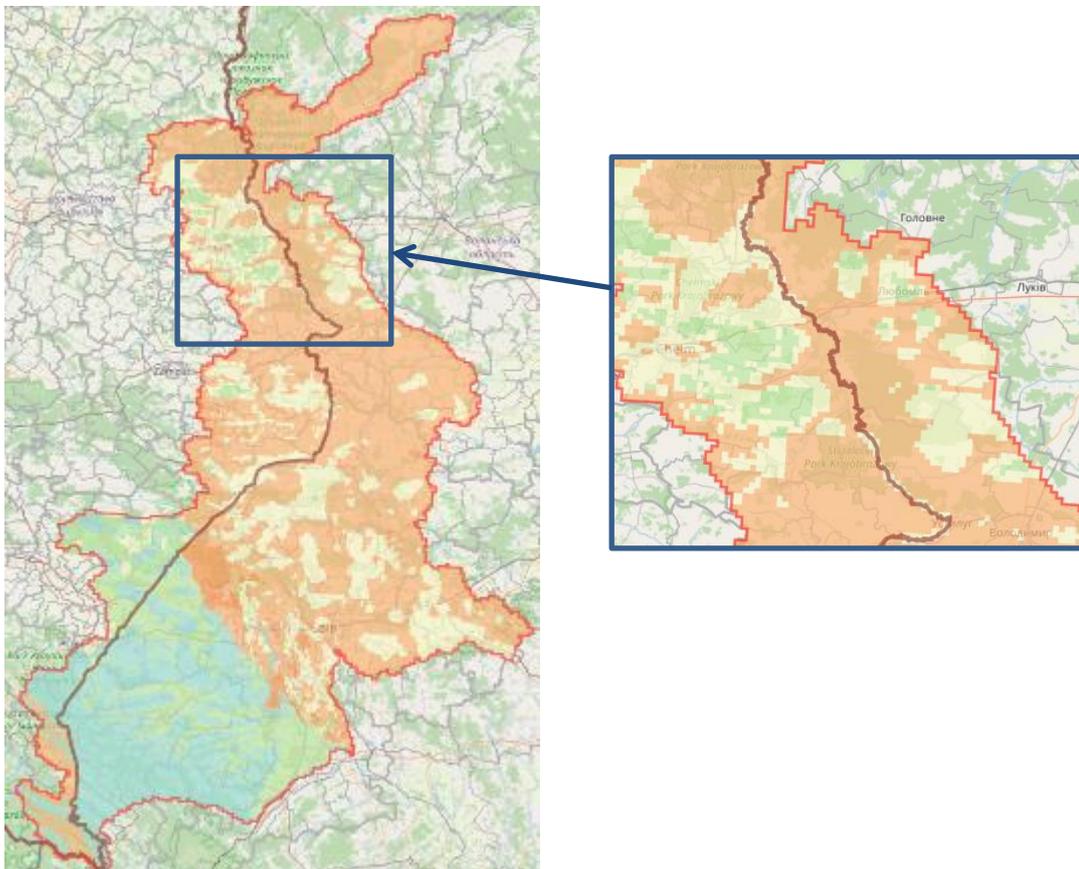

Attribute name	Attribute value

### 3.2. Depth to the main useful aquifer

#### < Map appearance

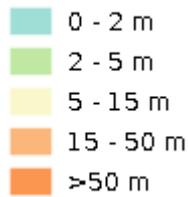

#### < Definition

The depth to main useful aquifer (MUA) is defined depending on the nature of the MUA water table as the depth from the ground surface to:

- < MUA unconfined groundwater table,
- < MUA confined groundwater table (that is, to impermeable / semi-permeable deposits limiting the MUA from the top).

#### < Legend

The "Depth to main useful aquifer" layer is shown in a pixel map. The blue color indicates the depth of 0-2 m, and the dark orange color indicates the greatest value of the depth to the MUA (>50 m).

< Attributes

Below are the attributes and vocabularies used to describe the " Depth to main useful aquifer ":

Attribute name	Attribute value
Depth to the MUA from (m)	< 0
	< 2
	< 5
	< 15
	< 50
Depth to the MUA to (m)	< 2
	< 5
	< 15
	< 50
	< > 50

**3.3. Hydroisohypses of the main useful aquifer**

< Map apperance

< Definition

**Hydroisohypses** óContour lines for connecting equal level groundwater head points of the main useful aquifer.

< Legend

The "Hydroisohypses of the main useful aquifer" are shown on the map as purple lines. Certain hydroisohypses have been defined as solid lines. On the other hand, the uncertain hydroisohypses - as

dashed lines in areas devoid of the main usable aquifer (MUA). Each hydroisohypse was assigned a numerical value, and subsequent hydroisohypses are cut every 10 m.

-  Certain
-  Uncertain

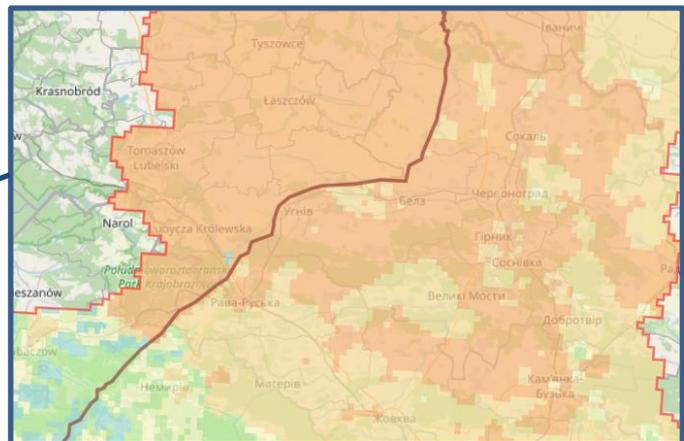

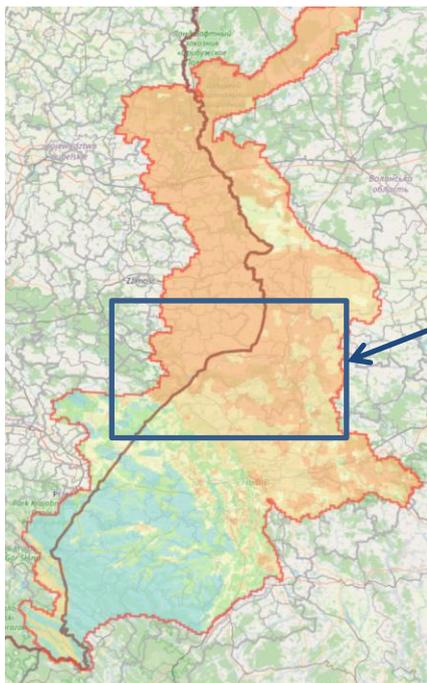

< Attributes

Below are the attributes and vocabularies used to describe the "Hydroisohypse of the main useful aquifer".

Attribute name	Attribute value
Value (m)	Intervals of isolines of the water head every 10 m
Type (Type)	<ul style="list-style-type: none"> <li>&lt; Certain</li> <li>&lt; Uncertain</li> </ul>

**3.4. Thickness of the main useful aquifer**

< Map appearance

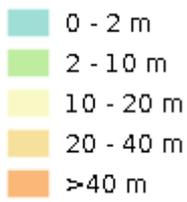

< Definition

Thickness of the main useful aquifer, measured between its top and bottom.

< Legend

The "Thickness of the main useful aquifer" is shown on a pixel map. Blue indicates the smallest thickness of 0-2 m, and dark orange indicates the largest value of the thickness of the main useful aquifer (>40 m).

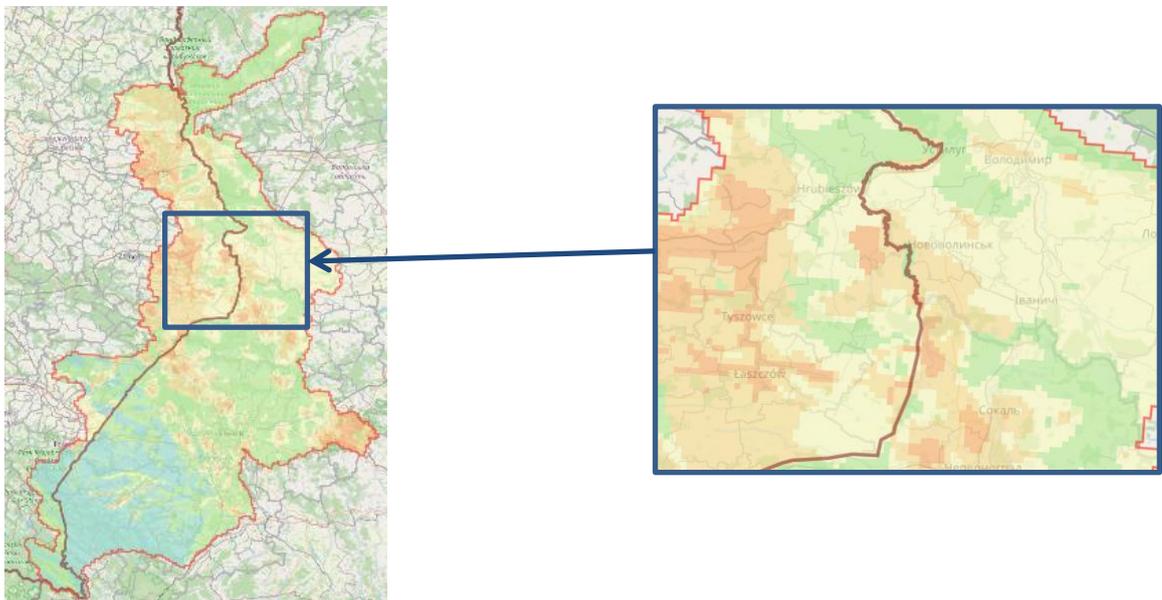

< Attributes

Below are the attributes and vocabularies used to describe the layer "Thickness of the main useful aquifer".

Attribute name	Attribute value
Thickness of MUA from (m)	< 0
	< 2
	< 10
	< 20
	< 40
Thickness of MUA to (m)	< 2
	< 10
	< 20
	< 40
	< > 40

**3.5. Transmissivity of the main useful aquifer**

< Map appearance

< Definition

Transmissivity of the MUA - the rate at which water of the prevailing kinematic viscosity is transmitted through a unit width of the aquifer under a unit hydraulic gradient. It is equal to an integration of the hydraulic conductivities across the saturated part of the aquifer perpendicular to the flow paths.

< Legend

The "Transmissivity of the main usable aquifer" layer is shown on a pixel map. The blue color indicates a conductivity of 0-2 m<sup>2</sup>/day and the dark orange color indicates the highest conductivity value of MUA (>500 m<sup>2</sup>/day).

- 0 - 2 m<sup>2</sup>/day
- 2 - 100 m<sup>2</sup>/day
- 100 - 200 m<sup>2</sup>/day
- 200 - 500 m<sup>2</sup>/day
- >500 m<sup>2</sup>/day

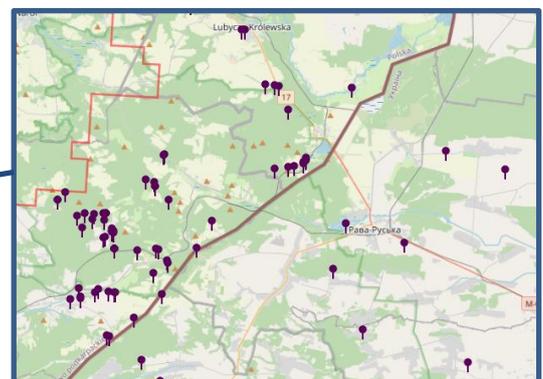

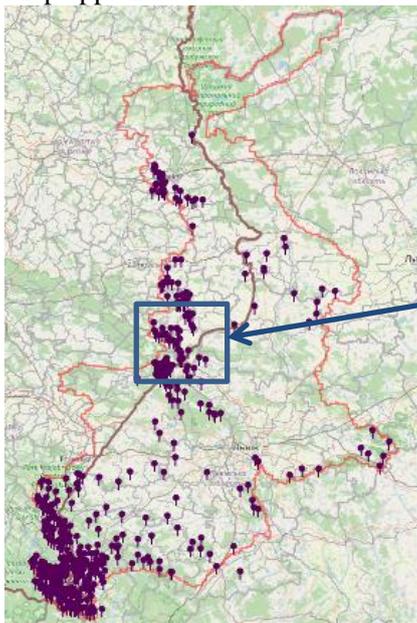

< Attributes

Below are the attributes and vocabularies used to describe the "Transmissivity of the main useful aquifer":

Attribute name	Attribute value
Transmissivity of MUA from (m <sup>2</sup> /d)	< 0
	< 2
	< 100
	< 200
	< 500
Transmissivity of MUA to (m <sup>2</sup> /d)	< 2
	< 100
	< 200
	< 500
	< > 500

**3.6. Springs**

< Map appearance

< Definition

Natural, concentrated outflow of groundwater on the ground surface.

< Legend

the symbol marks the spring on the map

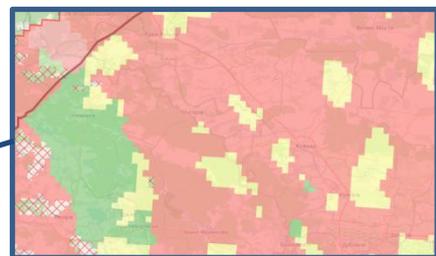

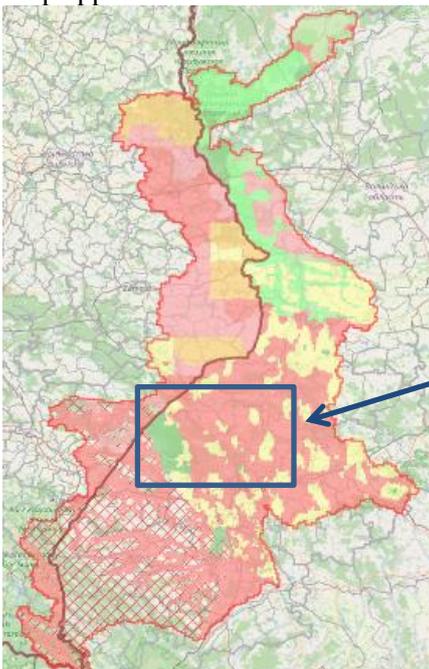

< Attributes

Below are the attributes and vocabularies used to describe the "Springs" layer:

Attribute name	Attribute value
Terrain elevation (m a.s.l.)	Value in m a.s.l.
Stratigraphy of aquifer	<ul style="list-style-type: none"> <li>&lt; alQ óalluvial Quaternary</li> <li>&lt; fgQ ófluvioglacial Quaternary</li> <li>&lt; Q óQuaternary</li> <li>&lt; Q-Ng óQuaternary-Neogen</li> <li>&lt; Q-Pl óQuaternary-Pliocene</li> <li>&lt; Q-Cr3 óQuaternary-Cretaceous</li> <li>&lt; M óMiocene</li> <li>&lt; Ng óNeogene</li> <li>&lt; Pg+Ng óPaleogene and Neogene</li> <li>&lt; Pg óPaleogene</li> <li>&lt; Ol óOligocene</li> <li>&lt; E óEocene</li> <li>&lt; Pg-Cr óPaleogene-Cretaceous</li> <li>&lt; Cr3 óUpper Cretaceous</li> <li>&lt; Cr óCretaceous</li> </ul>
Flow rate (l/s)	<ul style="list-style-type: none"> <li>&lt; Value in l/s</li> <li>&lt; no data</li> </ul>

**3.7. Insulation degree of the main useful aquifer**

< Map appearance

< Definition

The insulation degree of main useful aquifer - a qualitative index, which is established on the basis of the total thickness of low-permeable layers ( $k = 10^{-6}$ - $10^{-9}$  m/s) and practically impermeable ( $k < 10^{-9}$  m/s) located above the main useful aquifer.

< Legend

The layer "Isolation degree of the main useful aquifer" is shown on a pixel map.

Areas with no insulation to MUA are marked in red, areas with partial insulation are marked in yellow, and areas with complete isolation from MUA in dark green. There are also 4 types of areas with a dominant insulation value classified into different subclasses. Apart from the symbols above and in addition to the markings on the map, areas where there is no MUA have also been marked - the area filled with a red grid.

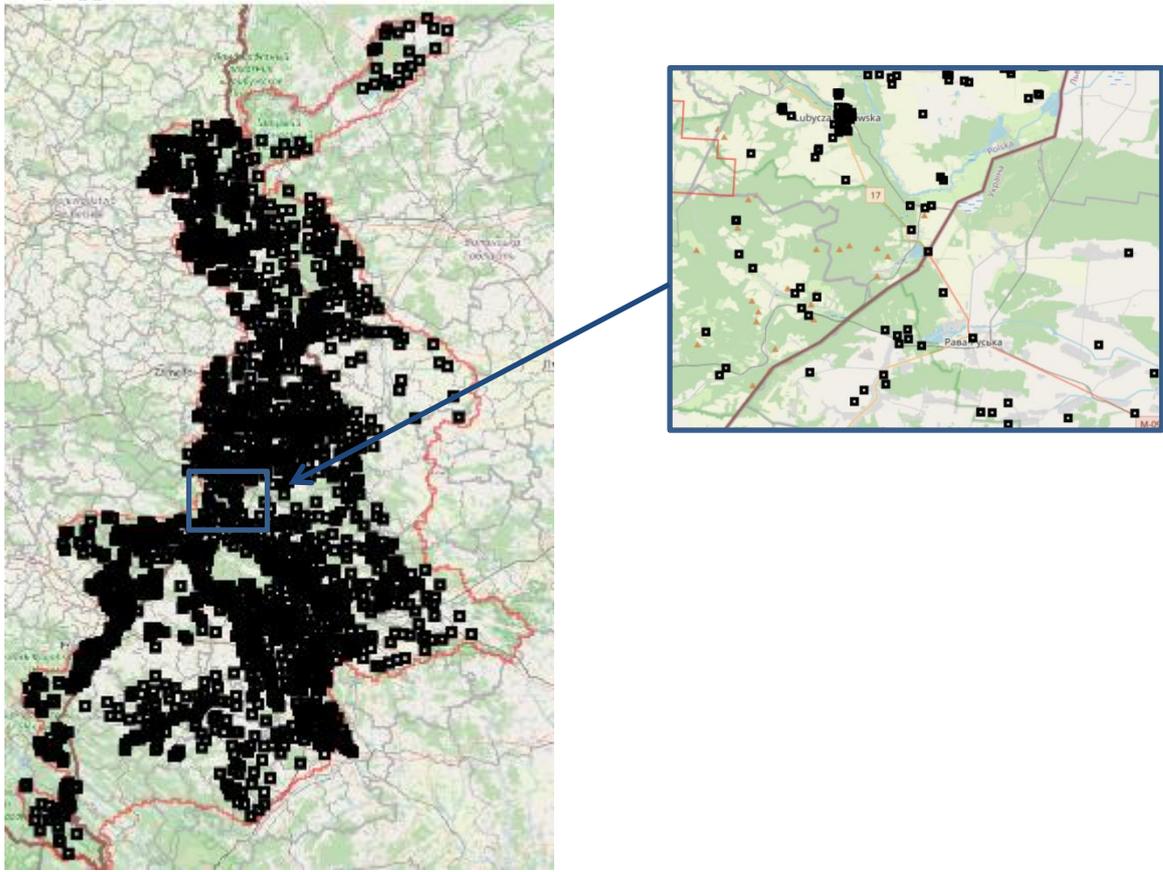

-  Absence of MUA
-  Dominance no insulation, subclass - partial insulation
-  Dominance partial insulation, subclass - no insulation
-  Dominance partial insulation, subclass - total insulation
-  Dominance total insulation, subclass - partial insulation
-  No insulation
-  Partial insulation
-  Total insulation

< Attributes

Name of the attribute	Attribute value
Insulation degree of the main useful aqifer	<ul style="list-style-type: none"> <li>&lt; no insulation</li> <li>&lt; dominance no insulation, subclass - partial insulation</li> <li>&lt; dominance partial insulation, subclass - no insulation</li> <li>&lt; partial insulation</li> <li>&lt; dominance partial insulation, subclass - total insulation</li> <li>&lt; dominance total insulation, subclass - partial insulation</li> <li>&lt; total insulation</li> </ul> absence main useful aquifer

### 3.8. Wells / Boreholes

#### < Map appearance

#### < Definition

A borehole made to determine the hydrogeological conditions, groundwater exploitation, observation, etc.

- Legend

■ the symbol marks a well/borehole on the map

- Attributes

Below are the attributes and vocabularies used to describe the "Wells/Boreholes" layer:

Attribute name	Attribute value
National number of borehole	National borehole number
Type of borehole	<ul style="list-style-type: none"> <li>&lt; research borehole</li> <li>&lt; exploitation borehole</li> <li>&lt; observation borehole</li> <li>&lt; exploratory borehole</li> </ul>
Water type	<ul style="list-style-type: none"> <li>&lt; ordinary</li> <li>&lt; medicinal</li> </ul>
Terrain elevation	< value in m a.s.l.
Year when the borehole was made	Year
Borehole depth	< value in m b.g.l.

### 3.9. Intakes

#### < Map appearance

#### < Definition

Groundwater intake - a set of devices used to abstract groundwater from one point, many points or from a certain area, supplying a specific user or for a specific purpose.

#### < Legend

 the symbol indicates an intake on the map

#### < Attributes

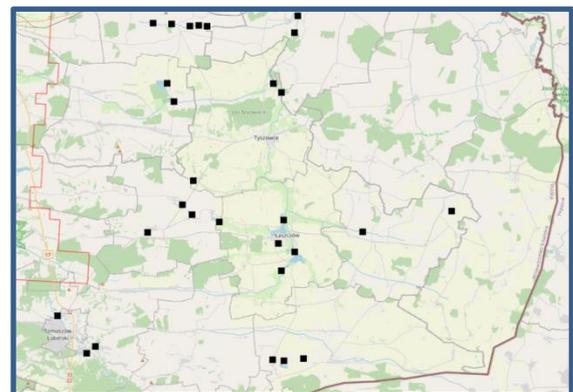

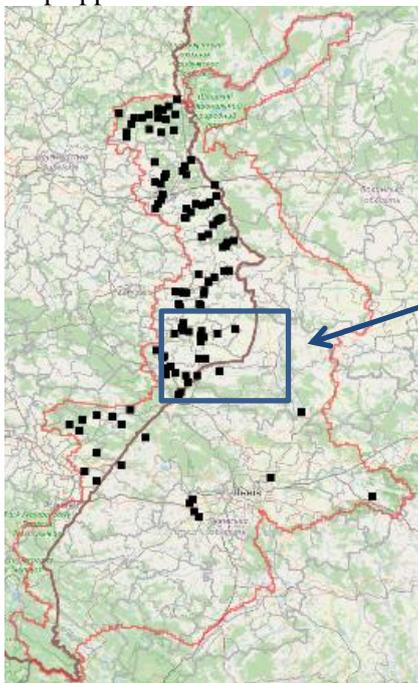

Below are the attributes and vocabularies used to describe the "Intakes" layer:

Attribute name	Attribute value
National number of intake	National intake number
Name of intake	The name of the town where the intake is located
Role of the intake	<ul style="list-style-type: none"> <li>&lt; Industrial</li> <li>&lt; Individual</li> <li>&lt; Communal (collective supply)</li> <li>&lt; Agricultural</li> <li>&lt; Fire-extinguishing</li> <li>&lt; Research</li> <li>&lt; Balneological</li> <li>&lt; Other</li> <li>&lt; No data</li> </ul>
Stratigraphy of the aquifer	<ul style="list-style-type: none"> <li>&lt; Q óQuaternary                             <ul style="list-style-type: none"> <li>o Q (al) óalluvial Quaternary</li> <li>o Q (Qp) óPleistocene Quaternary</li> <li>o Pg+Ng óPaleogene and Neogene</li> <li>o Pl óPliocene</li> </ul> </li> </ul>

	<ul style="list-style-type: none"> <li>&lt; Cr óCretaceous <ul style="list-style-type: none"> <li>○ Cr3 óUpper Cretaceous</li> </ul> </li> </ul>
Depression magnitude range for authorized resources (m b.g.l )	< depth value in meters below ground level (m b.g.l.)
Exploitation resources Q (m3/h)	< no data
Exploitation resources Pg+Ng (m3/h) (m3/h)	< The volume of the exploitation resource from a Quaternary aquifer in m <sup>3</sup> /h
Exploitation resources Cr (m3/h)	< The volume of the exploitation resource from Paleogene and Neogene aquifer in m <sup>3</sup> /h
Exploitation resources Q-(Pg+Ng) (m3/h)	< The volume of the exploitation resource from a Cretaceous aquifer in m <sup>3</sup> /h
Exploitation resources Q-Cr (m3/h)	< The volume of the exploitation resource from Quaternary- Paleogene and Neogene aquifer in m <sup>3</sup> /h
Exploitation resources Q-Cr (m3/h)	< The volume of the exploitation resource from Quaternary-Cretaceous aquifer in m <sup>3</sup> /h
Exploitation resources (Pg+Ng)-Cr (m3/h)	< The volume of the exploitation resource from Paleogene and Neogene ó Cretaceous aquifer in m <sup>3</sup> /h

### 3.10. Groundwater damming devices

#### < Map appearance

#### < Definition

**Groundwater damming device**, it is understood as a hydrotechnical device (dams, weirs, sills, gates - on rivers / streams) or other devices causing flow inhibition and damming of groundwater, i.e. raising of the groundwater table level.

< Legend

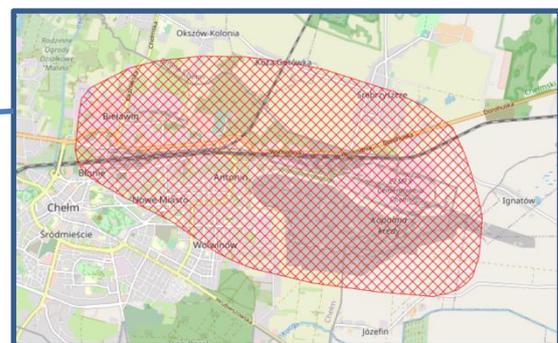

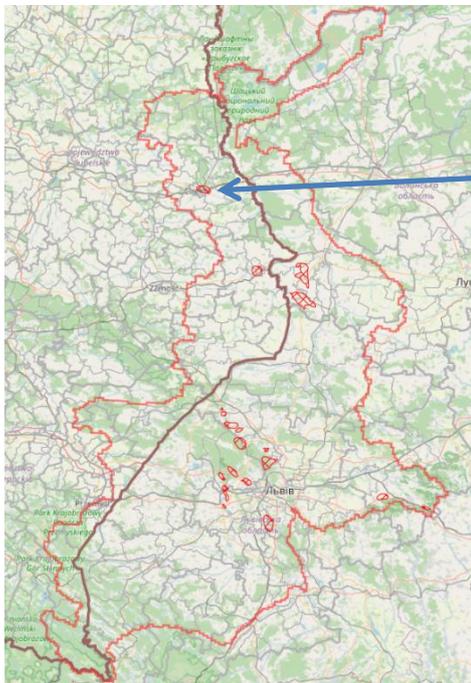

- Location of the damming device

< Attributes

Attribute name	Attribute value
Function of groundwater damming device	<ul style="list-style-type: none"> <li>&lt; fish pond</li> <li>&lt; recreation, fish pond</li> <li>&lt; industrial</li> <li>&lt; irrigation</li> </ul>
Type of groundwater damming device	<ul style="list-style-type: none"> <li>&lt; small earth dam</li> <li>&lt; weir</li> <li>&lt; no data</li> </ul>
Name of the river, lake on which the hydrotechnical device exists	< Name of the lake, river, or reservoir
Location	The name of the settlement where it is located
Dam area	Area in km <sup>2</sup>
Local aquifer type	<ul style="list-style-type: none"> <li>&lt; alQ - Quaternary alluvial</li> <li>&lt; Cr óCretaceous</li> </ul>
Reservoir type	<ul style="list-style-type: none"> <li>&lt; floodplain reservoir</li> <li>&lt; bed reservoir</li> <li>&lt; water damming</li> </ul>

### 3.11. Areas of depression cones

< Map appearance

< Definition

Zone of lowering the piezometric surface (groundwater table) caused by pumping or drainage of aquifers by intakes, mines, etc. Depression of regional importance, with an area of more than 50 km<sup>2</sup> or smaller ones with a mirror depression of more than 50 m.

< Legend

Areas with depression cones are marked on the map - the area filled with a red grid. 

< Attributes

Below are the attributes and vocabularies used to describe the "Areas of depression cones" layer.

Attribute name	Attribute value
Type of lowering the groundwater level	Cone from exploitation of groundwater
Drainage facility	Name of the facility
Stratigraphy of the drained aquifer	<ul style="list-style-type: none"> <li>&lt; Q óQuaternary</li> <li>&lt; M óMiocene</li> <li>&lt; Cr3 óUpper Cretaceous</li> <li>&lt; D3 óUpper Devonian</li> </ul>
Depression cone surface (km2)	Area in km <sup>2</sup>
Year of update	Year

### 3.12. Groundwater bodies

According to the definition given in the Water Framework Directive, groundwater bodies include groundwater that occur in aquifers with porosity and permeability, enabling a significant uptake in water supply to the population or flow with an intensity significant for shaping the desired state of surface water and groundwater dependent ecosystems.

Given the fact that Ukraine and Poland have completely different methods of extraction of groundwater bodies, this shape is divided. Separately, the Polish GWB (GWB-Poland) and a group of Ukrainian GWB layers (GWB-Ukraine Q, GWB-Ukraine D3, GWB-Ukraine M, GWB-Ukraine Cr3) are shown. The definition is the same for all types of shapes. Therefore, in this instruction, we will focus on the differences, namely: how the map looks on the portal, the legend and attributes.

### 3.13. Groundwater pollution source

#### 3.13.1. Groundwater pollution source – wastewater treatment plants

##### < Map appearance

##### < Definition

**Groundwater pollution source** - an object causing intentional or accidental release of undesirable substances into groundwater as a result of anthropogenic activity or for natural causes. One of the important groundwater pollution source for the research area is **wastewater treatment plants**.

##### < Legend

▲ the symbol indicates the place of groundwater pollution - the wastewater treatment plant on the map

##### < Attributes

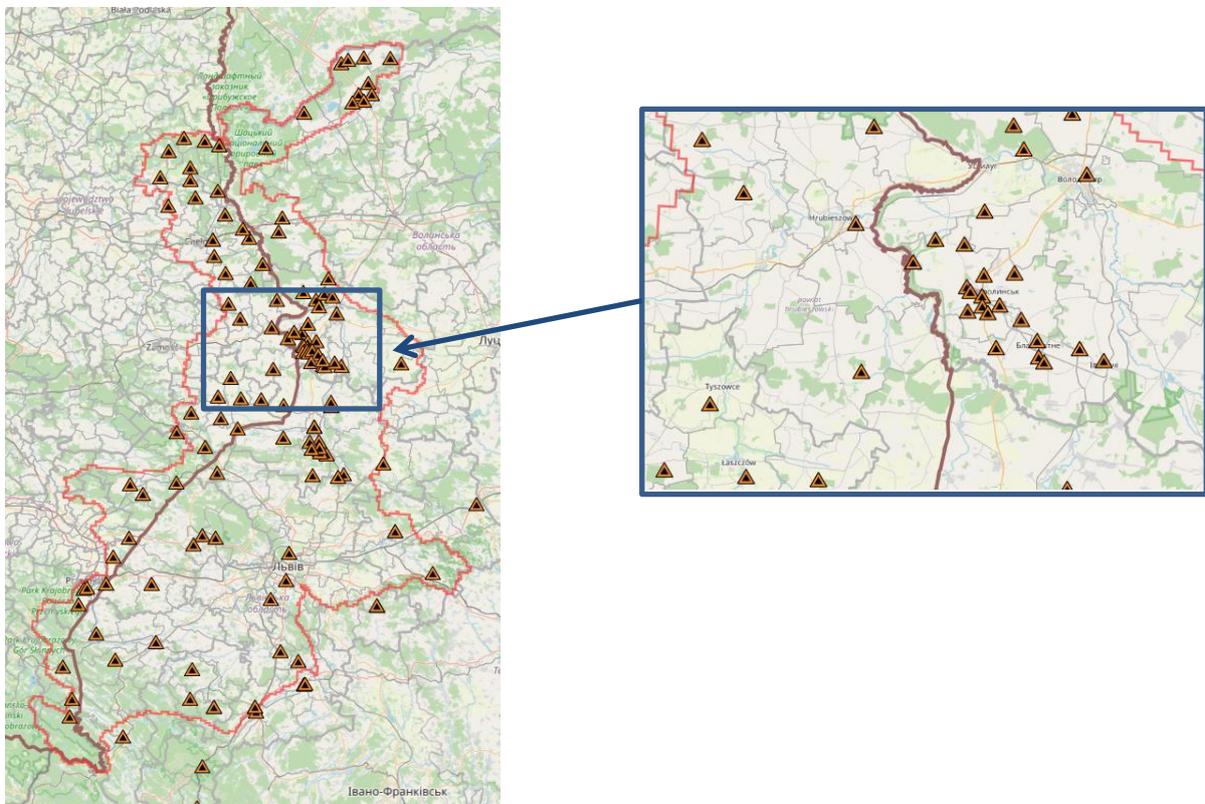

Below are the attributes and vocabularies used to describe the "Groundwater pollution source ó wastewater treatmentplants " layer

Attribute name	Attribute value
Region or Voivodeship	Voivodeship in Poland or region in Ukraine
District or County	County in Poland or district in Ukraine
Place	Name of the town where the wastewater treatment plant is located
Type of wastewater treatment plant	<ul style="list-style-type: none"> <li>&lt; Mechanical</li> <li>&lt; Biological</li> <li>&lt; Mechanical-biological</li> </ul>

Capacity of the wastewater treatment plant (m <sup>3</sup> /day)	< Mechanical-biological-chemical
	< No data
Type of wastewater	Maximum amount of sewage in m <sup>3</sup> /day
	< Municipal
Wastewater receiver	< Industrial
	< Municipal-industrial
	< No data
	Name of the river, watercourse, drainage (filtration fields)
Data source	Name of the institution
Validity of data	Year

### 3.13.2. Groundwater pollution source - landfills

#### < Map appearance

#### < Definition

**Groundwater pollution site** - artificial accumulation of pollutants (actual or potential) in groundwater. Pollution hotspots can be of various spatial nature: spot (drilling, petrol stations, warehouses), linear or strip (roads, pipelines), surface (landfills, sedimentation tanks, drainage and irrigation fields) and area (fertilization and chemicalisation of agriculture). This work focuses on the pollution hotspots that are the most important for the research area, which are: wastewater treatment plants and waste landfills, including mining heaps.

#### < Legend

 the symbol indicates the place of groundwater pollution - the landfill on the map

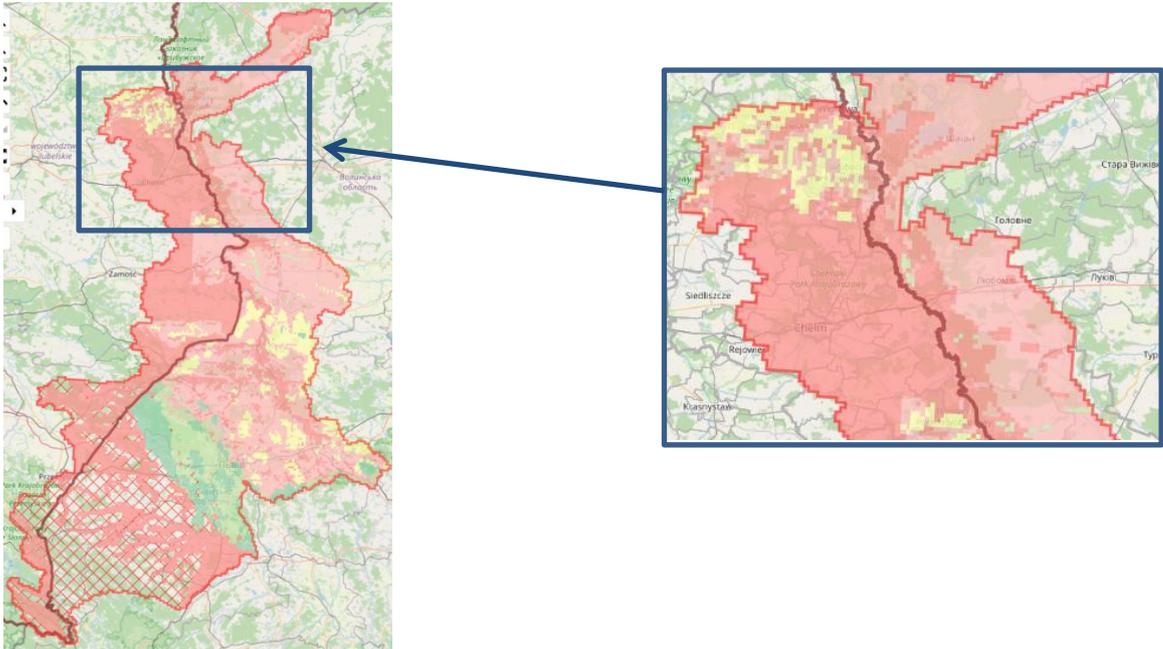

< Attributes

Below are the attributes and vocabularies used to describe the "Groundwater pollution source - waste landfills"

Attribute name	Attribute value
Region or Voivodeship	Voivodeship in Poland or region in Ukraine
District or Counties	County in Poland or district in Ukraine
Community or Municipality	A municipality in Poland or a community/commune in Ukraine
Place	The name of the town where the landfill is located
Landfill area (ha)	Area in ha
Waste storage method	<ul style="list-style-type: none"> <li>&lt; above-level</li> <li>&lt; sub-level</li> <li>&lt; mixed</li> <li>&lt; unselective</li> <li>&lt; no data</li> </ul>
Technical security	<ul style="list-style-type: none"> <li>&lt; leachate drainage</li> <li>&lt; landfill bottom insulation</li> <li>&lt; lack of protection</li> <li>&lt; degassing wells</li> <li>&lt; landfill gas capture system</li> <li>&lt; no data</li> </ul>
The origin of the stored waste	<ul style="list-style-type: none"> <li>&lt; municipal</li> <li>&lt; industrial</li> <li>&lt; municipal-industrial</li> <li>&lt; mining</li> <li>&lt; no data</li> </ul>
Type of waste deposited hazard	<ul style="list-style-type: none"> <li>&lt; dangerous</li> <li>&lt; non-hazardous</li> <li>&lt; no data</li> </ul>
The condition of the landfill	<ul style="list-style-type: none"> <li>&lt; open</li> <li>&lt; not used</li> <li>&lt; closed without reclamation</li> <li>&lt; closed during reclamation</li> <li>&lt; closed reclaimed</li> <li>&lt; closed during liquidation</li> </ul>
Year of the landfill closure	Year
Groundwater monitoring	<ul style="list-style-type: none"> <li>&lt; yes</li> <li>&lt; no data</li> </ul>
Known contamination of groundwater	<ul style="list-style-type: none"> <li>&lt; yes</li> <li>&lt; no</li> <li>&lt; no data</li> </ul>
Data source	Name of the institution
Validity of data	Year

### 3.14. Grounwater vulnerability to pollution

#### < Map appearance

#### < Definition

Groundwater vulnerability is based on the concept that the natural environment provides protection to groundwater. The protection provided by different (hydro)geological conditions varies from one place to another.

*D k p f g o c p o u " h q t o w n c " o -q t f d a l h u k a t g t h e ' t i d e s o f s e p a g e k o s j u c o n s e r v a t i v e m "*  
pollutants through the vadose zone.

$$t = \frac{mW_o}{\sqrt[3]{\omega^2 k_z}}$$

t ófiltration time; m óthickness of the vadose zone; W<sub>o</sub> óvolumetric humidity; k<sub>z</sub> óvertical filtration coefficient of the vadose zone; óintensity of infiltration.

#### < Legend

- Very high
- High
- Average
- Low
- Very low
- ✕ Absence of MUA

The "Groundwater Vulnerability to Pollution" layer is represented by a pixel map. Red means very high susceptibility to groundwater pollution, and dark green means very low susceptibility to groundwater pollution. Areas where there are no hydrogeological units of the main usable aquifer were filled with a red grid.

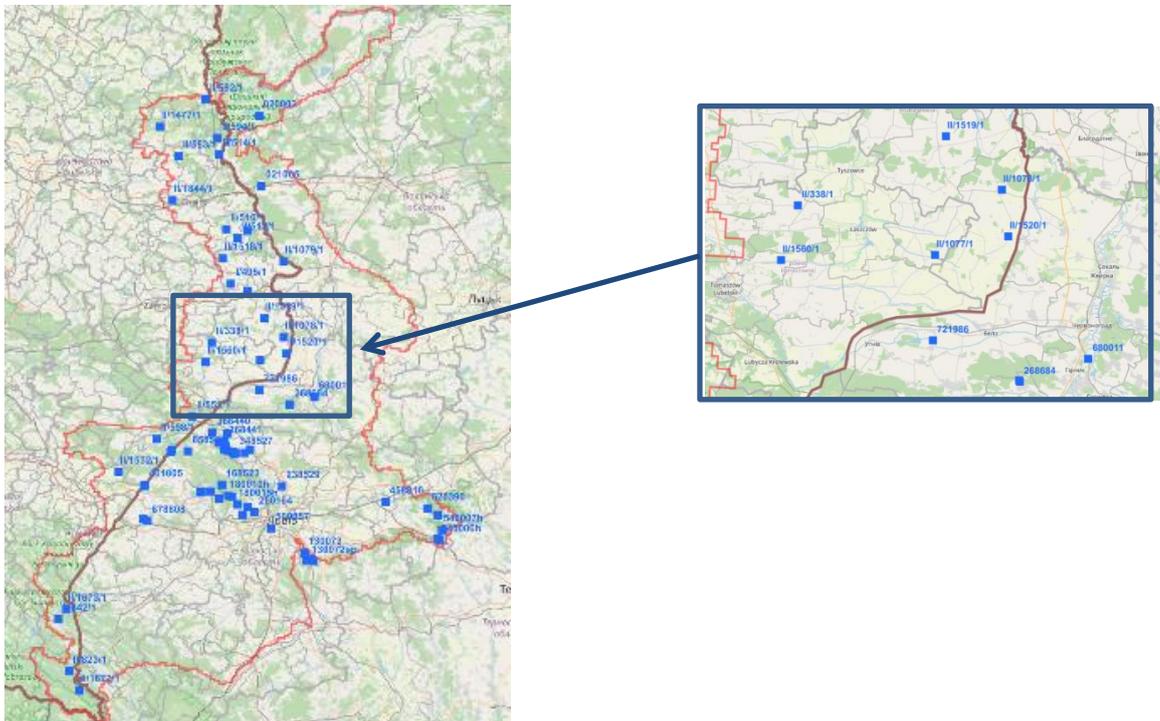

< Attributes:

Below are the attributes and vocabularies used to describe the "Groundwater Vulnerability to Pollution " layer.

Attribute name	Attribute value
Migration time of pollutant mass (year)	< value of migration time in years < 0 (when there is no main usable aquifer)
Vulnerability class	< Absence main useful aquifer < Very high < High < Average < Low < Very low

### 3.15. Groundwater monitoring points

< Map appearance

< Definition

**Groundwater monitoring point** - A station with appropriate devices for measuring and sampling groundwater for repeated hydrogeological observations carried out over a longer period.

< Legend:

■ the symbol indicates the location of the groundwater monitoring point

< Attributes:

Below are the attributes and vocabularies used to describe the "Groundwater monitoring points" layer.

Attribute name	Attribute value
Point National Number	National point number
Point Type	<ul style="list-style-type: none"> <li>&lt; piezometer</li> <li>&lt; well</li> <li>&lt; spring</li> </ul>
Groundwater level type	<ul style="list-style-type: none"> <li>&lt; unconfined</li> <li>&lt; confined</li> <li>&lt; spring</li> </ul>
Location	Name of the town where the monitoring point is located
Terrain elevation	Value in m a.s.l.
Year of starting observations	Year
Type of monitoring	<ul style="list-style-type: none"> <li>&lt; quantitative/chemical</li> <li>&lt; quantitative</li> <li>&lt; not observed</li> </ul>
Depth of observation well	Depth in m a.s.l.
The depth of the aquifer from	Depth in m a.s.l.
The depth of the aquifer too	Depth in m a.s.l.
Stratigraphy of the aquifer	<ul style="list-style-type: none"> <li>&lt; Q óQuaternary</li> <li>&lt; M óMiocene</li> <li>&lt; O1 óOligocene</li> <li>&lt; Pg óPaleogene</li> <li>&lt; Cr3 óUpper Cretaceous</li> <li>&lt; D3 óUpper Devonian</li> </ul>
The depth of the drilled groundwater level	Depth in m b.g.l.
Recommended for transboundary monitoring	<ul style="list-style-type: none"> <li>&lt; Yes</li> <li>&lt; No</li> </ul>

**Add group** - this feature allows you to create a group of layers yourself from the existing ones or adding a new layer in the form of a WMS or WMTS service to the group. After pressing the "add group" button, a window appears for entering the name of the group you want to add. Then enter the name of the group and confirm with the "add" button. We can add layers to the created group by hovering the cursor over the selected layer, pressing the right mouse button and dragging it to the created group.

Group options:  
 Create new group  Add to existing group

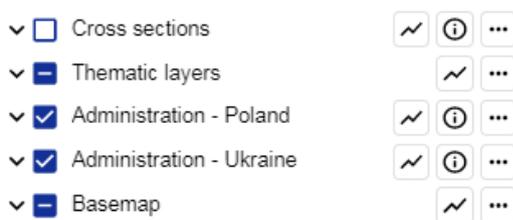

To add a new information layer to the map in the form of a WMS or WMTS service, use the "add layer" button, select the WMS or WMTS service type in the "basic options" tab, then enter the service address and press the "download layer" button. In the layer options, you can check or uncheck the "swap axes" function and give the added layer a name. You can also use the "group options" tool, which allows you to choose one of two functions:

- creating a new group,
- adding to an existing group.

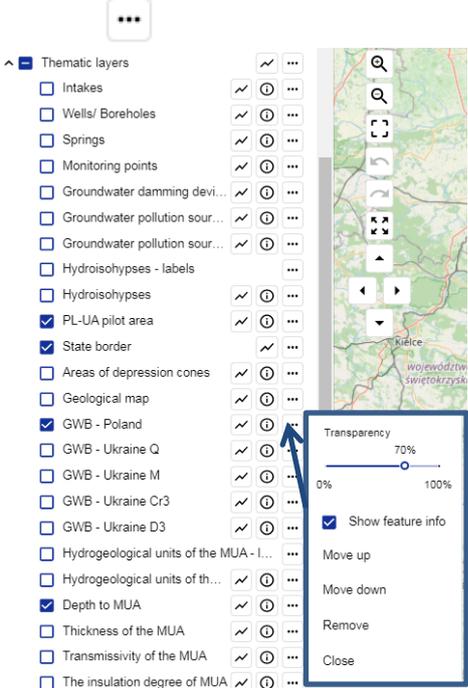

If you select the "create a new group" option, enter the name of the newly created group in the window below this function. However, if you select the "add to an existing group" option, enter the name of one of the existing groups in the window.

In the advanced options in the "translation" tab, we can also complete information about the layer by adding its name and description in English, Polish and Ukrainian.

You can also manage the "Legend" tab using the options available for individual layers or groups consisting of several layers:

The "legend" tab displays the layers that make up the map composition. Unchecking the name of a layer or layer group disables the visibility of the layer/layer group on the map. After the name of the layer or group of layers, there are function buttons that allow you to control the order and visibility of individual layers, and displaying the definition of the selected layer. A detailed description of the tools used is presented below:

	<p><b>Show map composition style</b> - pressing the button displays a new window with the symbols used on the map and their description.</p>
	<p><b>Show info about layer group</b> - pressing the button opens a window in which the definition of the selected layer is displayed.</p>
	<p><b>More actions</b> - pressing the button launches a window in which we can select from 4 to 6 functions that allow you to manage the visibility and create your own map compositions.</p> <p>The following features are available:</p> <p><b>Transparency</b> - allows you to set the transparency of the layer by moving the slider.</p> <p><b>Show feature info</b> - unchecking the check box in front of the layer or layer group name disables the visibility of information about objects. If the checkbox is selected, then after moving the cursor over the selected object from the displayed layer, you can use the left mouse button to open the window with the attributes of the selected object.</p> <p><b>Move up</b> - moves the layer up relative to other layers in the map composition.</p> <p><b>Move down</b> - moves the layer down relative to other layers in the map composition.</p> <p><b>Remove</b> - the tool allows you to delete layers.</p> <p><b>Close</b> - closes the window</p>
  	<p>Expand the layer group</p> <p>Collapse the layer group</p>
	<p>Check/uncheck boxes - Enable/disable layer visibility</p> <ul style="list-style-type: none"> <li><input checked="" type="checkbox"/> Make the layer visible</li> <li><input type="checkbox"/> Make the layer invisible</li> <li><input checked="" type="checkbox"/> There are visible and invisible layers in the group of shapes</li> </ul>

### Tabs in the Legend menu

The Legend menu is presented in 5 groups of data:

- ✓  Cross sections
- ✓  Thematic layers
- ✓  Administration - Poland
- ✓  Administration - Ukraine
- ✓  Basemap

Each of them has been discussed:

### 4.1. Cross-sections

- Cross sections [Line] [Info] [More]
- Cross sections labels [More]
- Cross sections [Line] [Info] [More]

V j Cross sections ö " v c d " e q p u k:u v u " q h " v y q " n c { g t u

- Cross sections ö labels ö ðäre the labels for the section lines;
- Cross sections ö ðäre the sections lines.

By selecting the "Cross sections" and "Cross sections - labels" checkboxes, lines of geological cross-sections and their descriptions will appear on the map.

< Definition:

The hydrogeological cross-section is a graphic representation of the hydrogeological conditions along the selected vertical plane due to the geological structure.

< Legend:

 The line on the map represents the cross-section line

< Attributes:

Attribute name	Attribute value
Name	Name of cross section: AA" BB" CC" DD"
Length (km)	Length of the cross-section in km
Cross section	Represented by an icon, after clicking which the user is redirected to a new browser tab, where a geological cross-section is displayed in *.jpg format.

#### 4.2. Thematic layers

- Thematic layers
- Intakes
- Wells/ Boreholes
- Springs
- Monitoring points
- Groundwater damming devices
- Groundwater pollution source - wastewater treatment plants
- Groundwater pollution source - waste landfills
- Hydroisohypses - labels
- Hydroisohypses
- PL-UA pilot area
- State border
- Areas of depression cones
- Geological map
- GWB - Poland
- GWB - Ukraine Q
- GWB - Ukraine M
- GWB - Ukraine Cr3
- GWB - Ukraine D3
- Hydrogeological units of the MUA - labels
- Hydrogeological units of the MUA
- Depth to MUA
- Thickness of the MUA
- Transmissivity of the MUA
- The insulation degree of MUA
- Groundwater vulnerability to pollution
- Conditions for the location of intakes
- Specific groundwater vulnerability to pollution
- Groundwater vulnerability to meteorological drought
- Intensity of agricultural pressure of a diffuse character
- Intensity of urban and industrial pressure of diffuse character
- Groundwater hazard
- Groundwater risk

Most of the layers in the "Thematic layers" tab have been described in the "Map composition" chapter. Here, the focus is on those that are not included in this list, namely:

- PL-UA pilot area
- State border
- Geological map
- Conditions for location of intakes
- Specific groundwater vulnerability to pollution
- Groundwater vulnerability to meteorological drought
- Intensity of agricultural pressure of a diffuse character
- Intensity of urban and industrial pressure of a diffuse character
- Groundwater hazard
- Groundwater risk

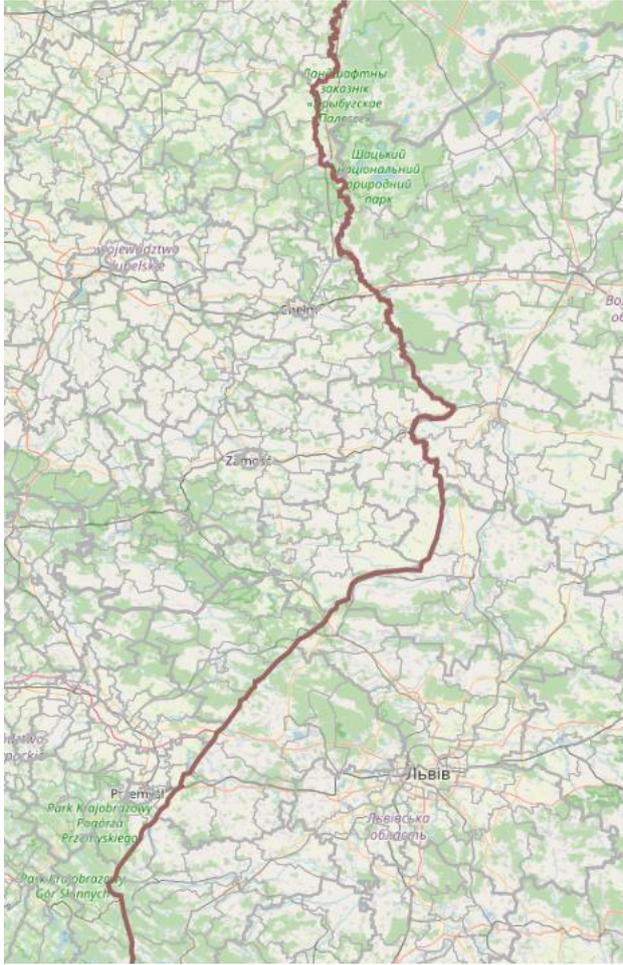

#### 4.2.1. PL-UA pilot area

This layer is the contour of the Polish-Ukrainian area of pilot research. Within this contour, thematic maps were made.

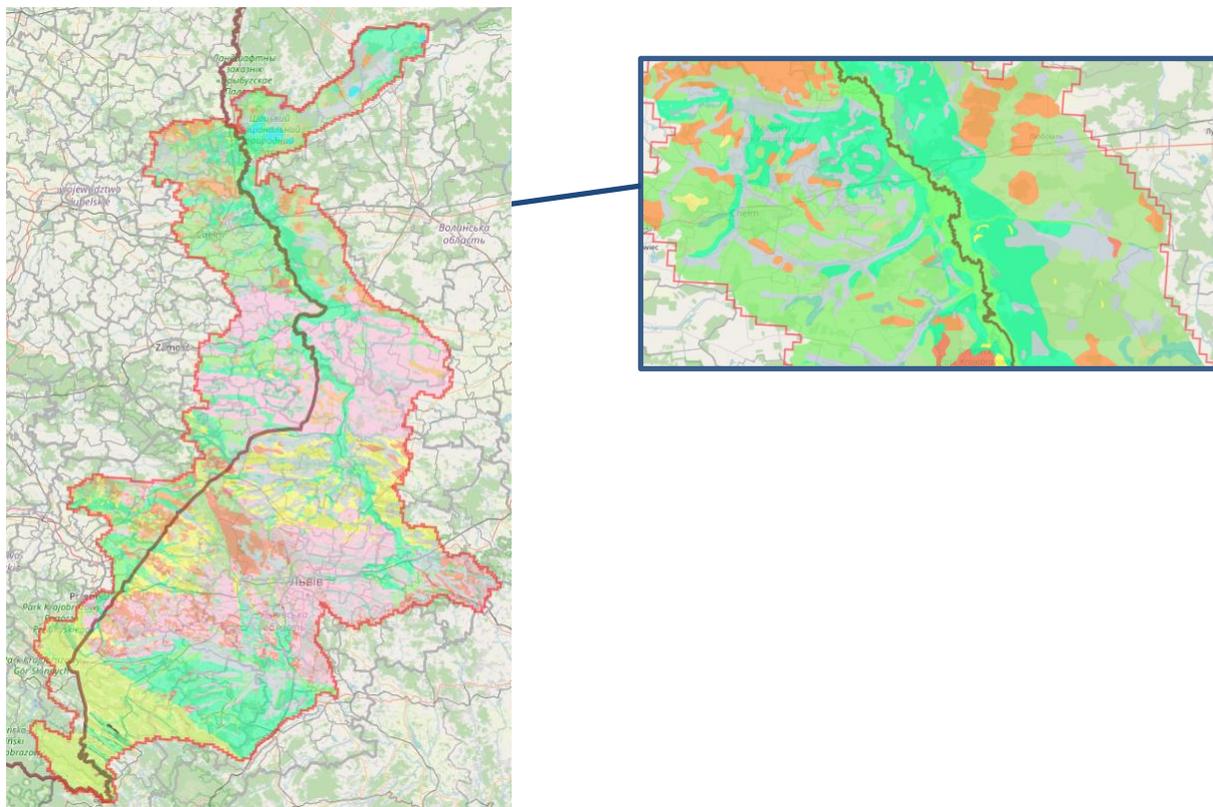

4.2.2. State border

This layer is the state border between Poland and Ukraine.

### 4.2.3. Geological map

The layer is a geological map of surface formations.

#### Legend:

ch,tH	Chemogenic and antropogenic sediments. Limestone tuffs (travertine), clays, loams, rubble, boulders, sands
bH	Quaternary system. Holocene series. Biogenic sediments. Peat, peat soils.
aH	Quaternary system. Holocene series. Aluvial sediments of floodplains. Silty sands, loams, gravel, pebbles
a,bH	Quaternary system. Holocene series. Aluvial+biogenic sediments. Organic silts, silty sands
dH	Quaternary system. Holocene series. Deluvial deposits of accumulative slopes. Landy loams, loams, gravel
aE-H	Quaternary system. Eopleistocene-Holocene series. Aluvial sediments of floodplain terraces. Sands, gravels, loamy sands, loams, pebbles.
aE-P1	Quaternary system. Eopleistocene series. Alluvial deposits of ancient longitudinal river valleys. Pebbles, rubble, loam, boulders.
dc, d, dp, dz, edP-H	Quaternary system. Pleistocene- Holocene series. Deluvial-colluvial, deluvial-proluvial, landslide, eluvial-deluvial deposits of accumulative slopes. Sands, sandy loam, loams, clays, gravel, rubble, boulders.
vP-H	Quaternary system. Pleistocene- Holocene series. Aeolian sediments of hills, dunes. Sands, loamy sands, loams.
vd,eP	Quaternary system. Pleistocene series. Aeolian-deluvial, eluvial cover sediments of loess accumulative-denudation uplands. Loess soil, loamy sands, loams
fP	Quaternary system. Pleistocene series. Fluvioglacial sediments of outwash denudation plains and lake sediments. Sands, sandy loams, loams.
gP	Quaternary system. Pleistocene series. Glacial (moraine) sediments of hills and plateaus. Glacial sands and gravels, moraine clays, gravel, boulders.
aIP	Quaternary system. Pleistocene series. Alluvial-lake sediments. Clays, loams, loamy sands
N1-2	Neogene system. Miocene series. Shallow coastal-marine terrigenous and evaporite sediments. Organodetrites and sulfur-containing limestones, sandstones, gypsum, gravel, stratification of clays, argillites, sandstones and siltstones
N1-1	Neogene system. Miocene series. Deep sea sediments conglomerates, siltstones. Layering of argillites, siltstones, sandstones.
K2-Pg	Upper Cretaceous-Paleogen system. Deep flysch deposits. Rhythmic gray flysch (sandstones, argillites, siltstones)
K2	Upper Cretaceous system. Terrigenous carbonate deposits of the epicontinental shelf. Marls, chalk, opoka, spongiolites, clay limestones.
K1-2	Lower-Upper Cretaceous system. Deep-water flysch terrigenous-carbonate deposits. Thin-plate marls, limestones, argillites, black silicon argillites, siltstones, sandstones, siderite inclusions, conglomerate lenses, layers of multicolored and fine-grained flysch.
surface waters	Surface waters

#### 4.2.4. Conditions for location of intakes

The conditions for location of new groundwater intakes layer is a derivative of 4 parametric layers - depth and transmissivity of the main useful aquifer, the presence of intakes and depression cones. A validation method was used, the result of which is a qualitative assessment of conditions divided into three classes.

$$X = \frac{A * B * C * D}{54} 100\%$$

X ó x c n w g " q h " v j ð f' k c k q p u g v l g q t' š E q e c v k q p " q h " k p v c m g u ö

Value of X (%)	Condition class for intakes location
0-33	Poor
33-66	Average
66-100	Good

#### A - depth of the main useful aquifer

Depth in m b.s.l.	Points
<15	3
15-50	2
>50	1

#### B ótransmissivity of the main useful aquifer

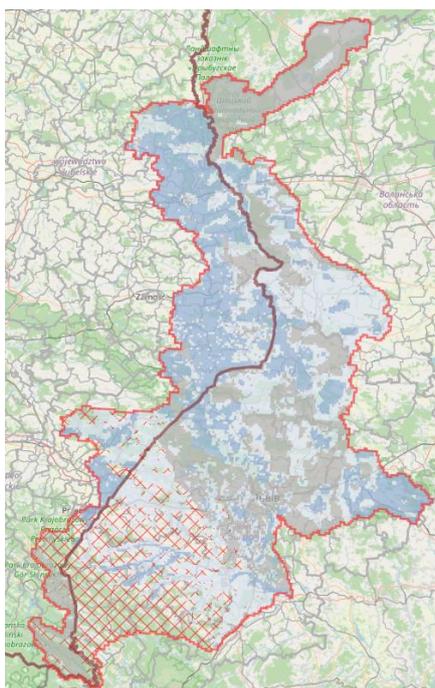

Transmissivity (m <sup>2</sup> /day)	Points
Absence of MUA	0
<100	1
100-200	2
>200	3

#### C- intakes

Number of intakes in a calculation block	Points
0	3
1-3	2
>3	1

#### D óarea of depression cones

Presence of depression cones in a calculation block	Points
yes	1
no	2

Legend:

- Good
- Average
- Poor
- ✕ Absence of MUA

4.2.5. Specific groundwater vulnerability to pollution

The specific vulnerability of groundwater to pollution was determined using the ranking method, taking into account three parameters considered decisive: 1) the presence of groundwater pollution hotspots, 2) the degree of isolation of the main useful aquifer, 3) the nature of land use - Corine Land Cover. Specific groundwater vulnerability to pollution has been divided into 5 classes.

$$X = \frac{A * B * C}{27} 100\%$$

X ó x c n w g " q h " v j g " r  
i t q w p f y c v g t " x w n p g t c d

Value of X (%)	Class of the specific groundwater vulnerability to pollution
0-20	Very low
20-40	Low
40-60	Average
60-80	High
80-100	Very high

A - degree of insulation of the main useful aquifer

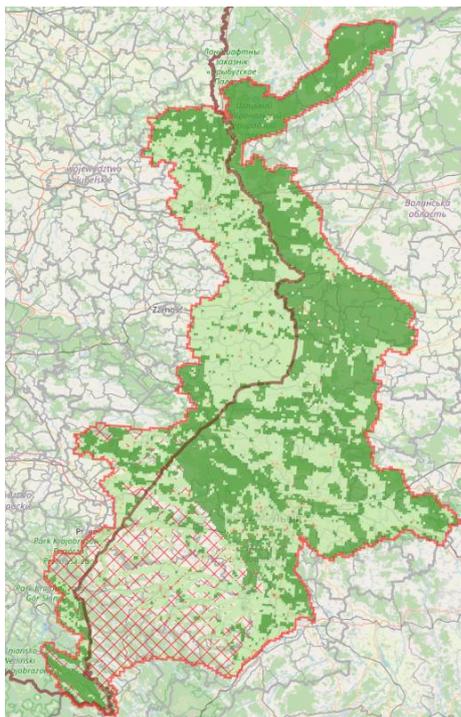

Insulation degree	Points
C	1
b, bc, cb	2
a, ab, ba	3

B ó nature of land use ó Corine Land Cover

Class	Points
Forest and semi-natural areas	1
Wetlands	1
Water bodies	1
Agricultural areas	2
Artificial surfaces	3

C ó groundwater pollution hotspots (wastewater treatment plants + landfills)

Presence of groundwater pollution hotspots in a calculation block	Points
yes	3
no	1

Legend:

- Very high
- High
- Average
- Low
- Very low
- ✕ Absence of MUA
- ✕ No analysis

4.2.6. Groundwater vulnerability to meteorological drought

Groundwater vulnerability to meteorological drought was determined using the rank method, taking into account five parameters that are considered decisive: 1) amplitude of groundwater level fluctuations; 2) the number of existing water intakes; 3) areas of depression cones; 4) type of groundwater level; 5) thickness of the main useful aquifer.

$$X = \frac{A * B * C * D * E}{162} 100\%$$

X - value of the parameter "groundwater vulnerability to meteorological drought"

Value of X (%)	Enclosure of groundwater vulnerability to meteorological drought
0-20	Very low
20-40	Low
40-60	Average
60-80	High
80-100	Very high

A - amplitude of groundwater level fluctuations at the nearest monitoring point with an unconfined groundwater table in a given catchment

Amplitude of fluctuations	Points
Higher than the catchment average	2
Lower than the catchment average	1

B - intakes

Number of intakes in calculation block	Points
0	1
1-3	2
>3	3

C - areas of the depression cones

Presence of depression cones in the calculation block	Points
YES	3
NO	1

D - Hydrogeological units of the main useful aquifer

Character of groundwater table	Points
periodic	1
swobodne	3

E - Thickness of the main useful aquifer

Thickness of MUA	Points
<10	3
10-20	2
>20	1

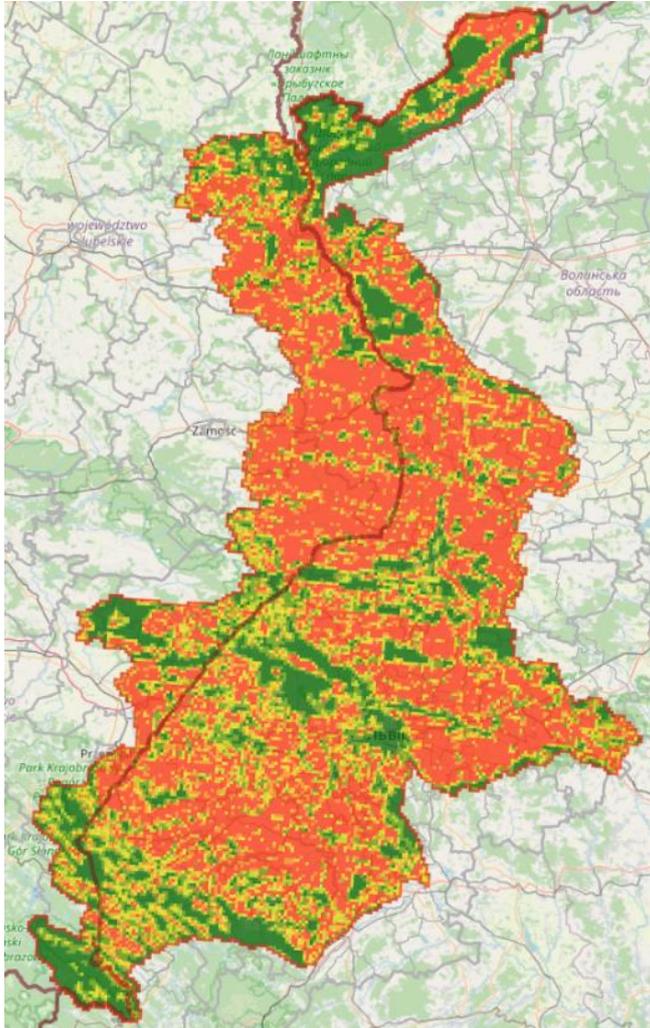

Legend:

- High
- Average
- Low
- Very low
- ✕ Absence of MUA

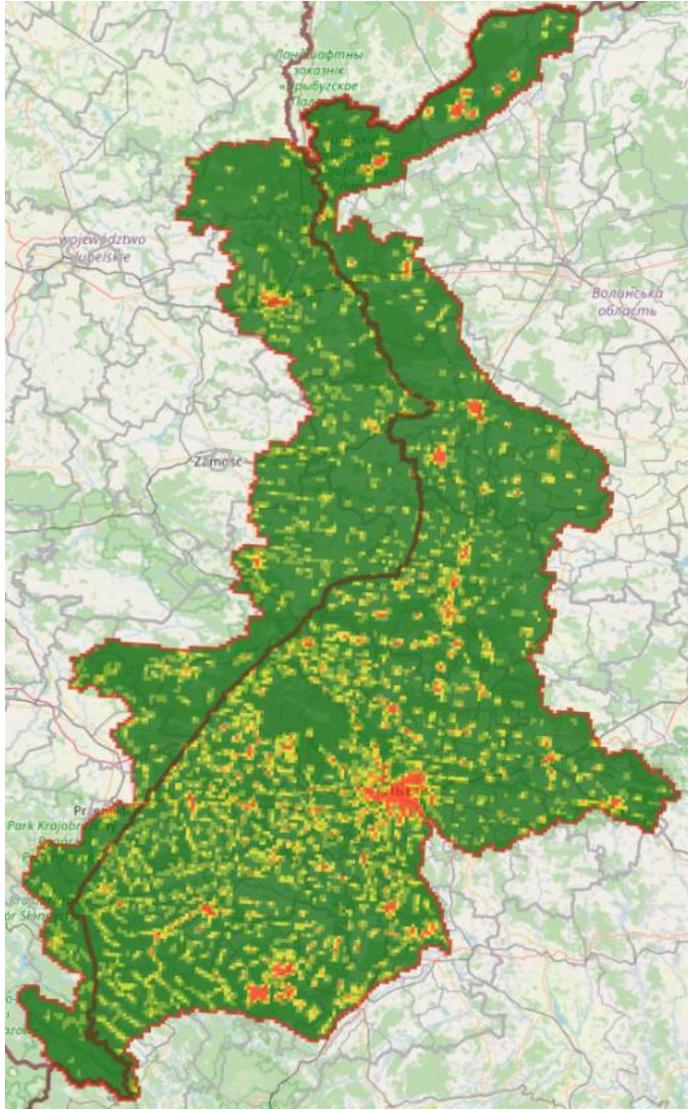

#### 4.2.7. Intensity of agricultural pressure of a diffuse character

This layer is presented on the map as pixels measuring 1x1 km. Agricultural pressure is calculated from the "CORINE land cover" layer as the share of the area (from 0 to 1) of agricultural land in the calculated pixel

4.2.8. *Intensity of urban and industrial pressure of a diffuse character*

This layer is presented on the map in the form of pixels measuring 1x1 km. Urban-industrial pressure is calculated from the "CORINE land cover" layer as the area fraction (from 0 to 1) of artificial surfaces (cities, industrial facilities) in the calculated pixel.

#### 4.2.9. Groundwater hazard

The cumulative pressure rating (GW hazard) within each computing cluster was estimated by the formula:

$$GW \text{ hazard} = ((\sum HI_i \times F) + (\sum W \times R))/n,$$

HI<sub>i</sub> – Hazard indices of diffuse pollutants for land use categories;

F – share in the computational cluster area of a given land use category,

W – point impact index weight;

R – rank of the point impact index;

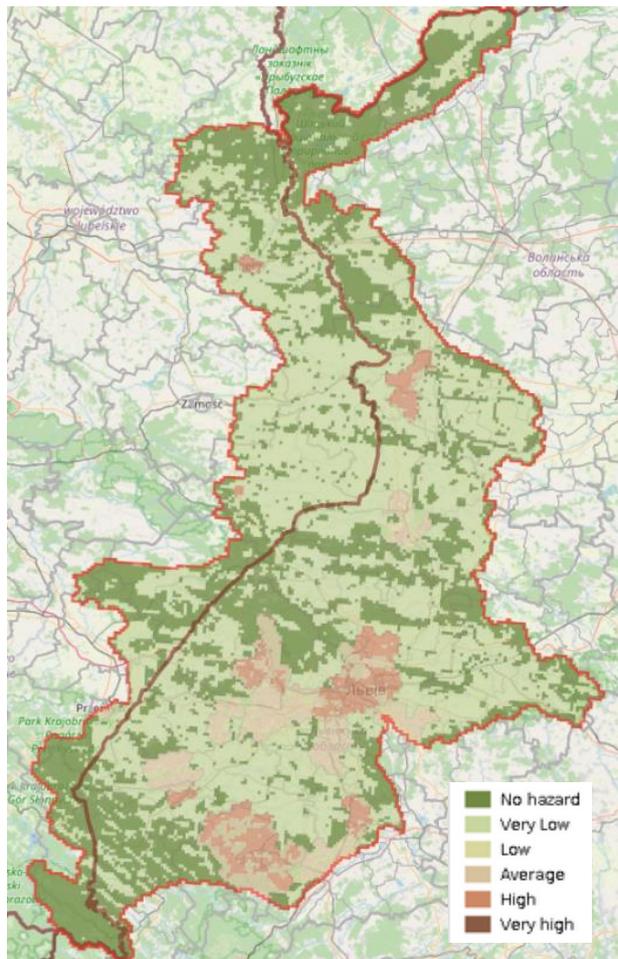

n – number of indicators included in the assessment in a given cluster.

The details of the parameters included in the calculation formula can be found in the report

<https://eu-waterres.eu/nextcloud/index.php/s/zL3DHaQsMtwjY6c>

The assessment has been made according to the following scale

Groundwater hazard	index
No hazard	0 – 0,10
Very Low	0,11 – 0,20
Low	0,21 – 0,30
Average	0,31 – 0,50
High	0,51 – 0,70
Very High	0,71 – 1,00

#### 4.2.10. Groundwater risk

The groundwater risk assessment map was created by combining the groundwater vulnerability to pollution map and the groundwater hazard map, as the groundwater risk depends on both, potential diffuse pollutions and the vulnerability of aquifers

$$\text{GW Risk} = \text{HI} \times \text{Index GW vulnerability}$$

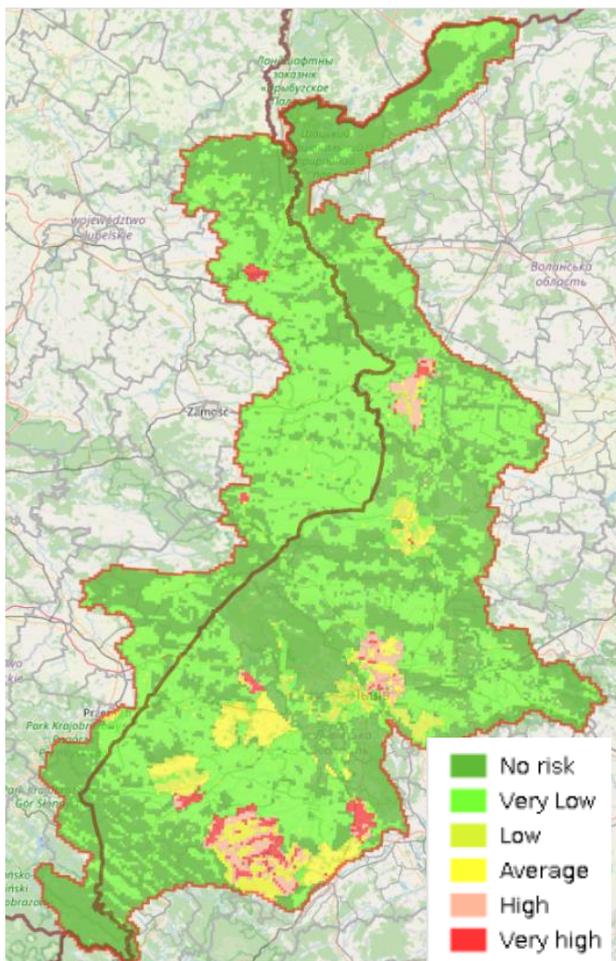

The details of the parameters included in the calculation formula can be found in the report

<https://eu-waterres.eu/nextcloud/index.php/s/zL3DHaQsMtwjY6c>

Risk assessment according to the index:

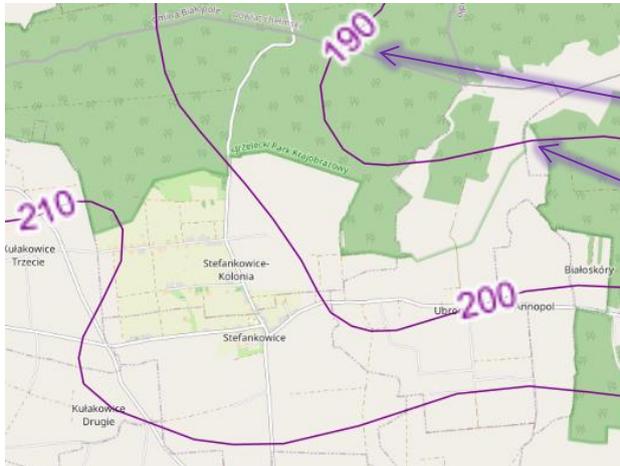

Groundwater risk	Индекс
No risk	0,0 - 0,5
Very Low	0,51 - 1,0
Low	1,1 - 1,5
Average	1,51 - 2,0
High	2,1 - 2,5
Very High	2,51 - 3,9

Map view

#### 4.2.11. Hydroisohypses – labels

This is an auxiliary layer that shows the hydroisohyps values on the map. It is advisable to use together with the shape of hydroisohips.

Hydroisohypses - label

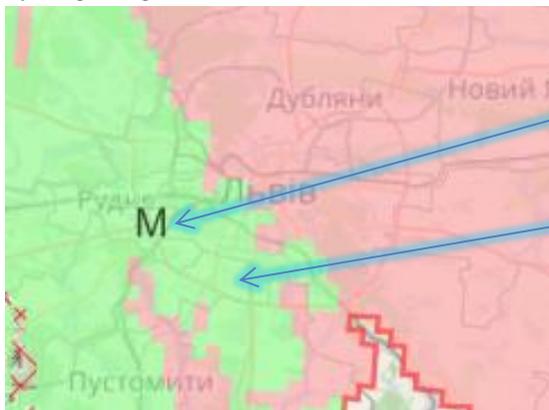

Hydroisohypses

Hydroisohypses - labels

Hydroisohypses

#### 4.2.12. Hydrogeological units of the MUA - labels

This is an auxiliary layer that shows the stratigraphy of the dominant sediments of the MUA hydrogeological units on the map. It is advisable to use the MUA together with the contour/area of the hydrogeological unit.

Symbol of the stratigraphy of the dominant sediments of the MUA hydrogeological unit

Contour/area of a unit dominated by Miocene deposits

Hydrogeological units of the MUA - labels

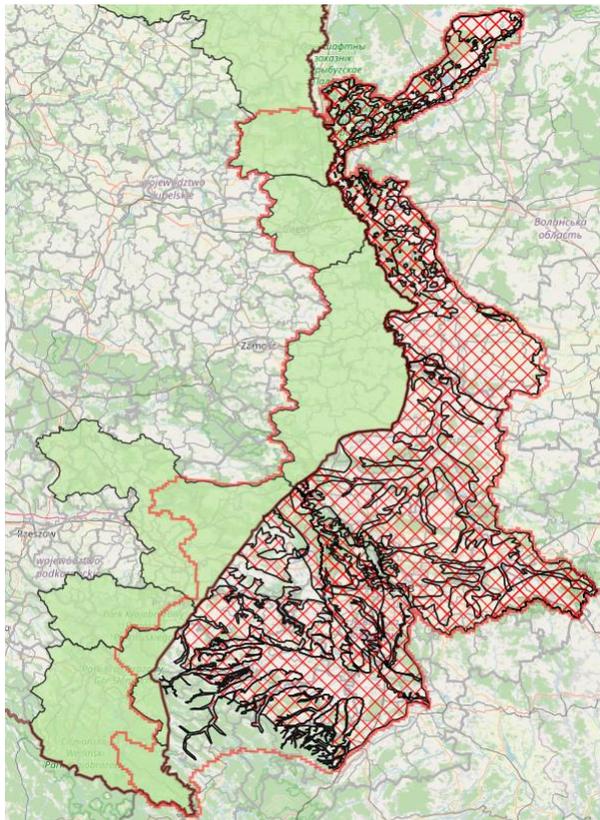

### 4.3. State of Groundwater Bodies

By selecting the "groundwater bodies" tab from the map composition, an additional layer appears with the assessment of the status (quantitative and qualitative) of groundwater bodies.

- State of groundwater bodies
- Quantitative state of GWB - Poland
- Quantitative state of GWB - Ukraine Q
- Quantitative state of GWB - Ukraine M
- Quantitative state of GWB - Ukraine Cr3
- Quantitative state of GWB - Ukraine D3
- Qualitive state of GWB - Poland
- Qualitive state of GWB - Ukraine Q
- Qualitive state of GWB - Ukraine M
- Qualitive state of GWB - Ukraine Cr3
- Qualitive state of GWB - Ukraine D3

The map shows the current assessment of the status of groundwater bodies with a gradation of "good" (green) or "poor" (orange).

For the territory of Ukraine, no such assessment has been carried out at present, therefore the area is marked with a red box with the annotation "no data".

Legenda:

- Poor
- Good
- No data

#### 4.4. Administration of Poland

Administrative units of Poland

Administration - Poland

- Municipality
- Counties
- Voivodeships

Legend

- Administration - Poland
  - Municipality
  - Counties
  - Voivodeships

Administrative units of Poland: voivodeships, counties, municipalities.

#### 4.5. Administration of Ukraine

Administrative units of Ukraine

Administration - Ukraine

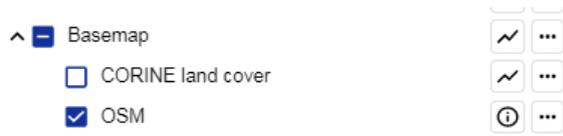

- Territorial communities
- Districts
- Regions

Legend

- Administration - Ukraine
  - Territorial communities
  - Districts
  - Regions

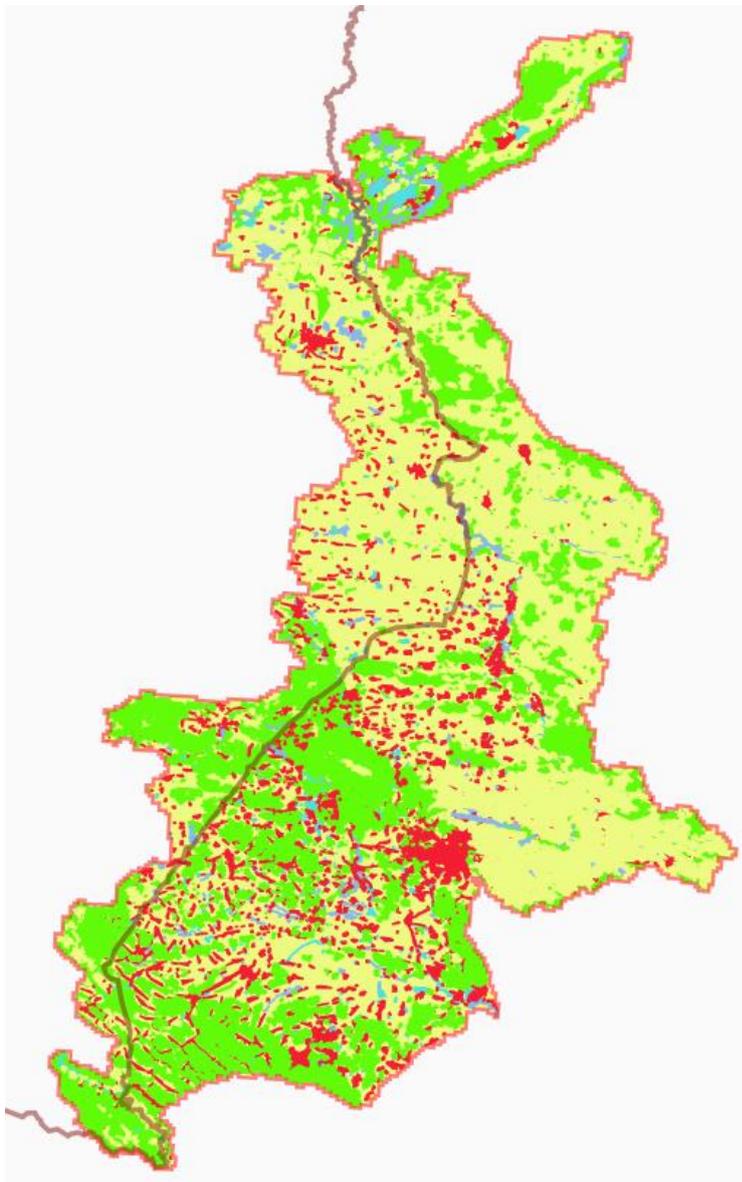

Administrative units of Ukraine: regions, districts, territorial communities.

#### 4.6. Base map

##### 4.6.1. CORINE land cover

For the Polish part of the pilot area, the reference layer Corine Land Cover (CLC2018) was used. The Corine base layer is dedicated only to European Union countries. For the Ukrainian part of the pilot area, an author's version was created based on the automatic classification of satellite data using a similar methodology for creating the Corine Land Cover reference map.

#### Legend

- Forest and seminatural areas
- Wetlands
- Water bodies
- Artificial surfaces
- Agricultural areas

4.6.2. OSM (Open Street Map)

### 5. Viewing data in the monitoring points tab

V j g " ð O q p k v q t k p i " r q k p v u ö " v c d " e q p v c k p u " v j g " h q n n q y k

- selection of monitoring point(s);
- quick determination of the location of a specific monitoring point;
- viewing information on the monitoring point;
- creating and printing specifications/characteristics in \*pdf format.

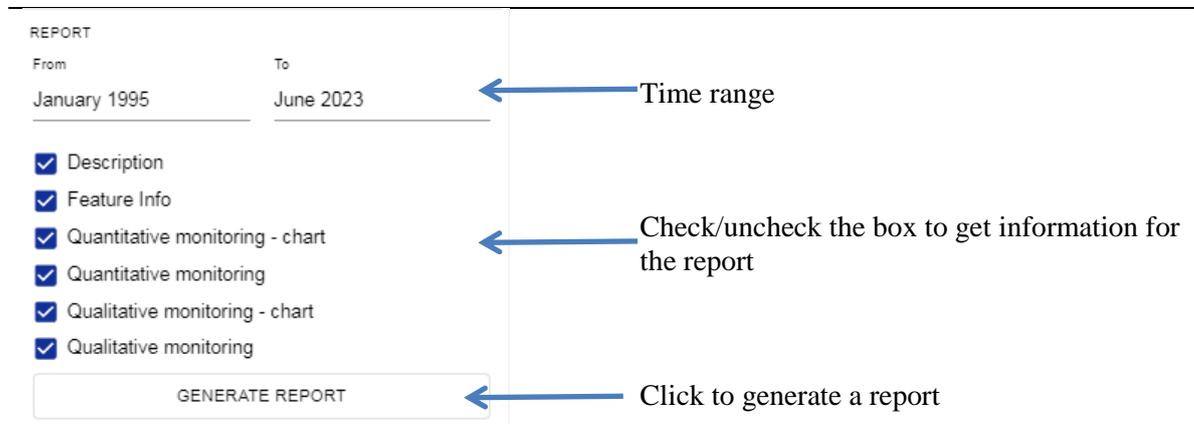

This tab opens the list of monitoring points contained in the "Monitoring points" layer.

1. Show location. Shows the location of the monitoring point on the map at a scale of 1:10,000.
2. After clicking on the icon, on the right side of the map window, a table of attributes/detailed characteristics for this monitoring point will be displayed (3).
4. Monitoring point selection field. You can select one or more monitoring points and generate a report in \*.pdf format.

To generate a report, it is necessary to scroll down the list of monitoring points to the "report" option (next figure).

The following options are available:

- selection of monitoring time frames;
- report content - select from the following criteria: description, attributes/characteristics of the facility, quantitative monitoring - chart, quantitative monitoring, qualitative monitoring - chart, qualitative monitoring.

When selecting a time period, click on the date in the "From" and "To" fields. A window will appear with the possibility of quick selection of the year and month of starting/ending research at this monitoring point.

To select a month, click on the month caption and select the required month from the table.

To select a year, click on the year and select the desired year from the list.

To define the content of the report, check or uncheck the checkboxes and click the "GENERATE REPORT" button. A \*.pdf file will be generated for selected monitoring points with information specified in the "REPORT" form.

The same report can be generated using the right panel "monitoring point information". However, in this case the generated report will concern only one monitoring point.

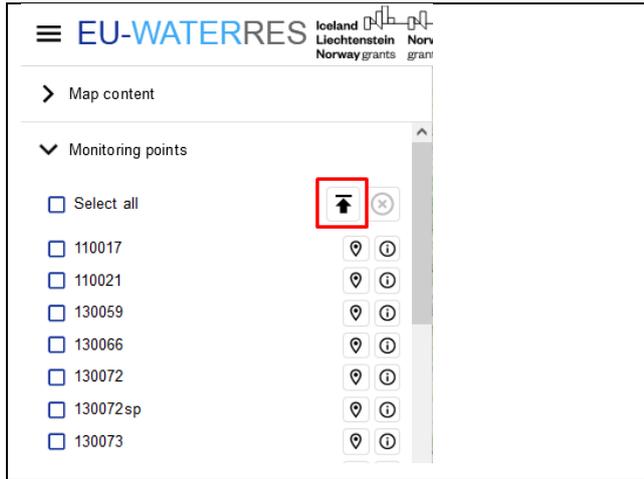

Period	Depth [m]	Range
2000 Q1	-0.44	1999-11 - 2000-01
2000 Q2	-0.57	2000-02 - 2000-04
2000 Q3	-0.21	2000-05 - 2000-07
2000 Q4	-0.06	2000-08 - 2000-10
2001 Q1	0.16	2000-11 - 2001-01
2002 Q1	-0.26	2001-11 - 2002-01
2002 Q2	-0.18	2002-02 - 2002-04
2002 Q3	-0.03	2002-05 - 2002-07
2002 Q4	-0.02	2002-08 - 2002-10
2003 Q1	-0.18	2002-11 - 2003-01
2003 Q2	-0.20	2003-02 - 2003-04

information on the selected monitoring point

data on the quantitative monitoring of the selected point

"GENERATE REPORT" button for creating a report in \*.pdf format. You can specify the content of the report from the specified criteria.

### Features available for logged in users

	<p>This feature is only available to logged in users. It allows you to import data from quantitative or qualitative monitoring for points that are in the database. The data must be prepared in *.csv files with a fixed structure. During import, the data already existing in the database for a given point are updated with data from the *.csv file.</p>
---	--

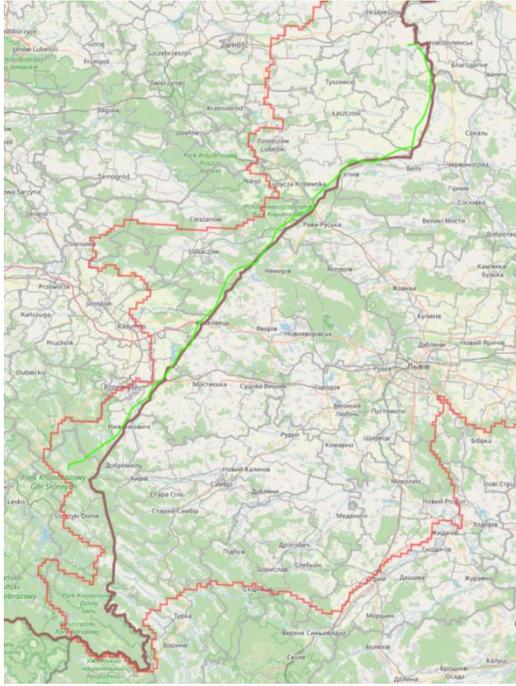

## 6. Viewing data in the "Geological cross sections" tab

In this tab you will find information on the geological structure along the given cross-section lines. After expanding the "Geological sections" tab, a list of profile lines will appear:

<p>Geological cross sections</p> <p>AA"</p> <p>BB"</p> <p>CC"</p> <p>DD"</p>	<ul style="list-style-type: none"> <li> - shows the course of the profile line on the map</li> <li> - displays "layer information" for a given profile line on the right side of the map window</li> <li> - closes the given profile line</li> </ul>
--	---

General view of the window with the selected profile line selected:

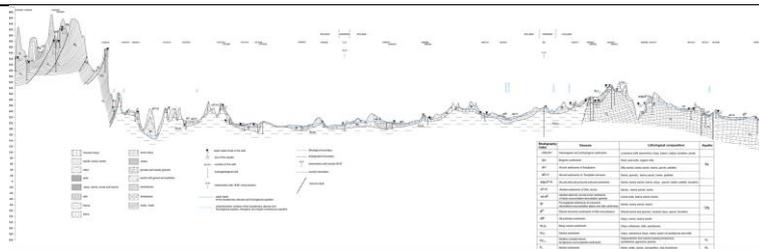

After clicking the icon next to the section line, it appears at maximum scale for full preview

Attribute name	Attribute value
Name	AA"
Length (km)	189.03
Cross section	

Displays profile line attributes on the right side of the map

The "cross section" icon generates the entire cross-section in \*jpg format, which appears in a new browser tab (see image below)

Geological section in \*jpg format

# 1. General information

## 1.1. Data format

The portal displays images in PNG format sent by GeoServer via WMS services (and the background from the OSM service). The geoserver generates these images based on spatial data in the PostgreSQL database. The data for this database were imported from the received SHP files.

## 1.2. Coordinate system

Spatial data in the PostgreSQL database is in the WGS84 reference system. By default, the portal layout is set to EPSG 3857 (Pseudo-Mercator) so-called Google Mercator.

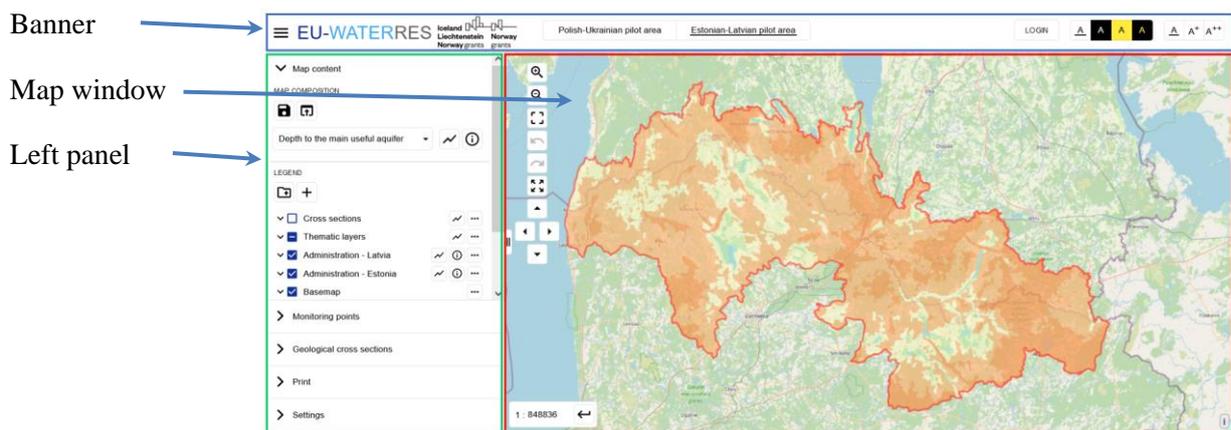

## 1.3. The spatial extent of the data

The area with the presented spatial data is located near the Estonian-Latvian border in the south part of Estonia and the north part of Latvia, in the basin of the Gauja/Koiva and Salaca/Salatsi rivers. It covers an area of approximately 9,500 km<sup>2</sup>. Its geographical coordinates are:

- Longitude from 57°14'N to 58°15'N;
- Latitude from 24°20'E to 27°26'E;

# 2. Map view

## 2.1. Main parts of the map portal

*Main window of the portal*

### Banner

The menu groups tools for logging in, changing the language, choosing colors and font size.

In order for the data displayed on the map to be legible for the user, it is advisable to adjust the appearance of the application window to individual preferences using the available functions.

### Function buttons on the banner

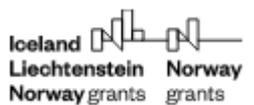

Open/close left panel

EU-WATERRES

Click to go to the project page:

- <https://eu-waterres.eu/>

Click to go to the fund page:

- <https://eeagrants.org/>

Selection of Polish-Ukrainian or Estonian-Latvian pilot area.

Log in – redirects the user to the login page. Logging in takes place after entering the user's login and password.

Selection of the language version of the portal: EN – English, PL – Polish, UA – Ukrainian English is selected by default.

### Features related to the accessibility of the map portal:

Selection of high-contrast colors:

- The default colour scheme is *black letters on a white background*
- Colour scheme *white letters on a black background*
- Colour scheme *black letters on a yellow background*
- Colour scheme *yellow letters on a black background*

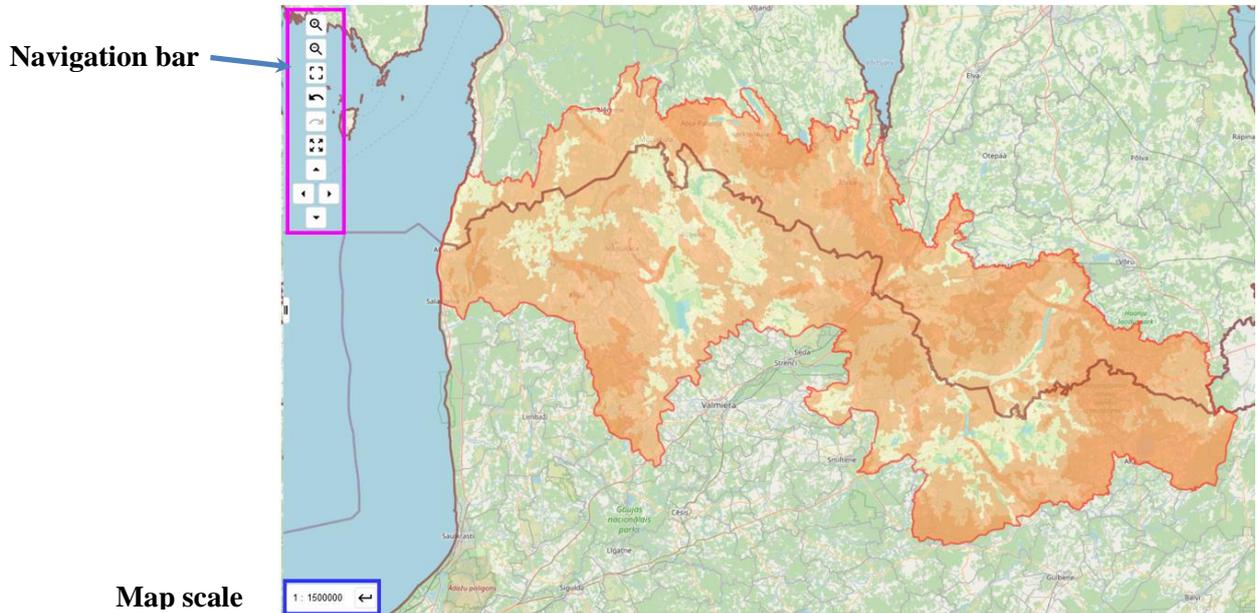

Font size selection buttons:

- medium
- large
- extra-large

By default, the font size is set on medium.

**Estonian-Latvian pilot area map window**

*Navigation bar*

		Zoom in (scroll the mouse wheel away from you)
		Zoom out (scroll the mouse wheel towards you)
		The map can also be enlarged by double-clicking the left mouse button in the map window. Thus, the scale increases 2 times.
		A button that activates the function of enlarging the selected area on the map.
		To activate it, click on the (a) button and then use the mouse cursor to highlight the area to be enlarged. Pressing this button (b) again will deactivate this function.
		Undo/Redo (preview). "Undo" button to restore the previous map scale. "Redo" button to repeat the scale of the map if canceled with the "Undo" button. If there have been no scale changes, the buttons are inactive (greyed out).
	Reset zoom to default view. When you click this button, the map will be scaled to include the selected pilot area.	
	Navigation buttons right/left/up/down. When you press the button, the map moves in the specified direction.	

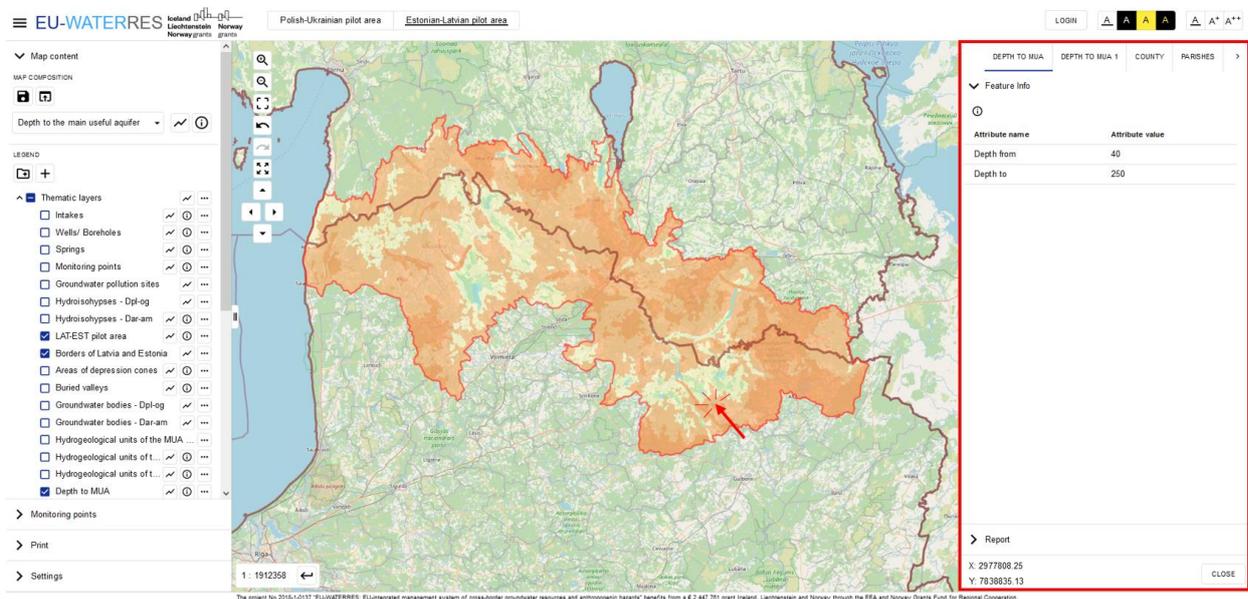

### Map scale window

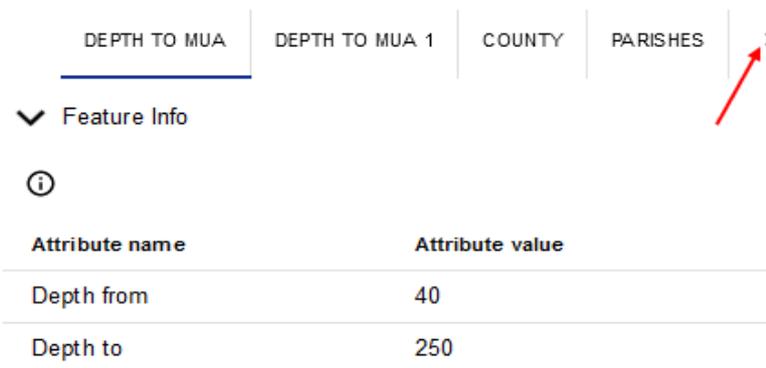

Map scale window. The number after the colon is the current map scale. You can set the scale you want. To do this, you need to write a scale and press enter or the button to the right of the numbers.

### Map window functionality

By clicking the mouse on the map, you can see the attributes of the object. To do this, click the left mouse button on the map object, and a window with information about the object will appear on the right side.

If there are several objects, you can view information about them all. You need to use the arrow and select the desired object for viewing.

*Feature info tab in the right panel*

DEPTH TO MUA ← 1

Feature Info ← 2

Information icon ← 3

The depth to main useful aquifer (MUA) is defined depending on the nature of the MUA water table as the depth from the ground surface to: • MUA unconfined groundwater table, • MUA confined groundwater table (that is, to impermeable / semi-permeable deposits limiting the MUA from the top). ← 4

### Left panel

The sidebar tools allow you to create your own map layout that can be printed in a .pdf file. Using the button  on the banner, you can expand or collapse the side panel. If you hold and drag the button , you can expand or narrow the left pane while changing the width of the map window.

The side panel menu consists of 5 items:

**Map content** – The tab opens a menu with map content. The tool is used to manage the visibility of layers on the map, preview the markings applied to the map, and select the map's coordinate system.

**Monitoring point** – The tab opens the menu with monitoring points. The tool allows you to turn on the visibility of selected or all monitoring points on the map, display their attributes and create reports and charts.

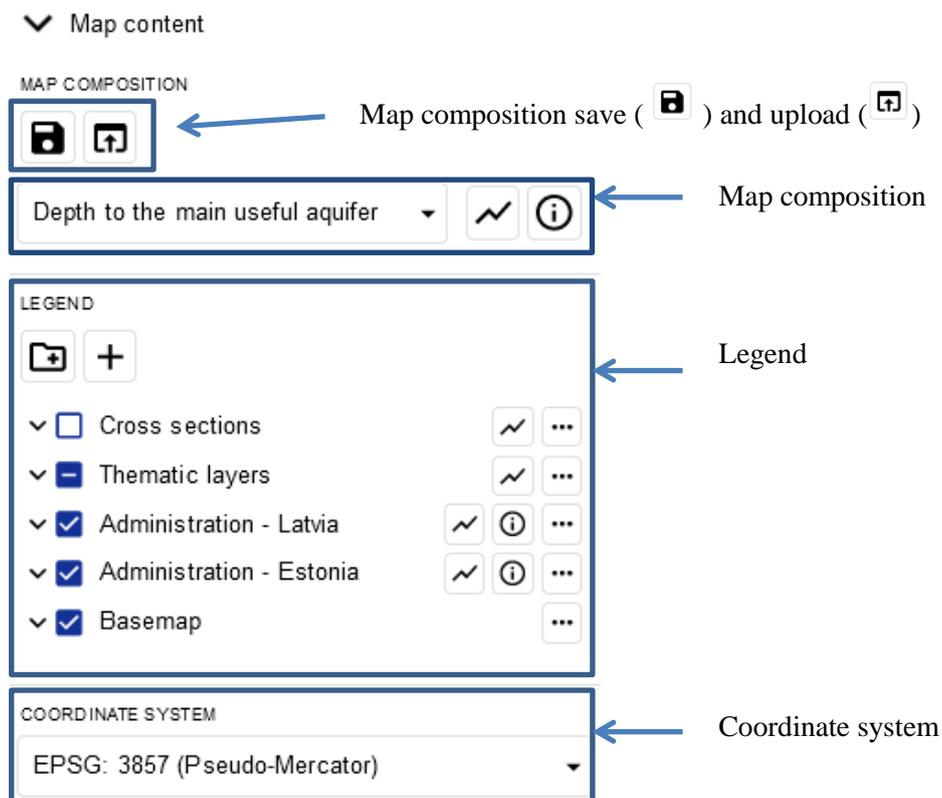

**Geological cross section** – The tab opens a menu with geological cross-sections. The tool allows you to find a selected geological cross-section and display the attributes of the selected object.

**Print** – The tab opens a menu with printing options. The tool is used to define print parameters of the created map composition.

**Settings** – The tab opens a menu with portal display settings. The tool allows you to set the diagonal of the used monitor and provides the current version of the application.

«Map content» tab

Map content - the tool is used to manage the visibility of layers on the map, preview the markings used on the map, and select the map's coordinate system. It consists of three tabs: map composition, legend, coordinate system.

Allows you to select the layer that will be displayed in the map window.

MAP COMPOSITION

Show composition style - pressing the button displays a new window in the application with the symbols used on the map and their description.

Show information about the composition - pressing the button launches a window in which the definition of the selected layer is displayed.

← You can select a thematic map to display from the drop-down list

**Coordinate system menu**

In the tab, it is possible to select the coordinate system in which the map composition will be displayed.

COORDINATE SYSTEM

To change the coordinate system, click on the field with the name of the default coordinate system. Then a list of coordinate systems appears, from which we select one from the list. When selected, the map composition will be displayed in the changed coordinate system.

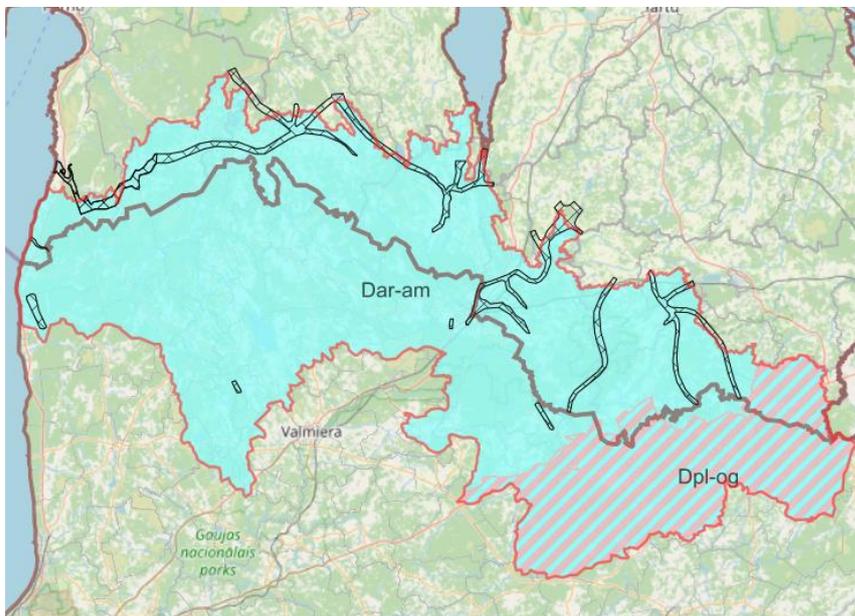

### 3. Map composition

The "Map composition" tab contains the following thematic layers:

- Hydrogeological units of the main useful aquifer
- Depth to the main useful aquifer
- Hydroisohypses of the main useful aquifer
- The thickness of the impermeable layer over main useful aquifer
- Transmissivity of the main useful aquifer
- Springs
- Thickness of the main useful aquifer
- Wells / Boreholes
- Intakes
- Buried valleys
- Areas of depression cones
- Groundwater bodies
- Groundwater pollution sites
- Vulnerability to groundwater pollution
- Groundwater monitoring points
- Groundwater mineralization for main useful aquifer

#### 3.1. Hydrogeological units of the main useful aquifer

- Map appearance

- Definition

An aquifer is a hydraulically continuous body of relatively permeable unconsolidated porous sediments or porous or fissured rocks containing groundwater. A useful aquifer is defined as an

aquifer or group of aquifers showing good hydraulic connectivity, with the parameters of the quantity and quality of water qualifying for municipal use.

- transmissivity  $> 50 \text{ m}^2/\text{d}$ ,
  - total thickness  $M \geq 5\text{m}$  (with an average state of retention),
  - shows a continuity of occurrence (with the accuracy of hydrogeological schematization appropriate for a map in the scale of 1: 50,000) in the area  $A > 20 \text{ km}^2$  (in conditions of good identification and clear spatial differentiation of hydrogeological conditions,  $A > 5 \text{ km}^2$  is allowed);
  - enable the execution of a drilled well with a recharge of over  $5 \text{ m}^3/\text{h}$ .
- Legend

The layer "Hydrogeological units of the main useful aquifer" is represented on the map by pixels with dimensions of 1000x1000 m filled with colors: blue and hatched pink, which indicate hydrogeological units of the MUA: fractured or terrigenous.

-  Fractured
-  Terrigenous

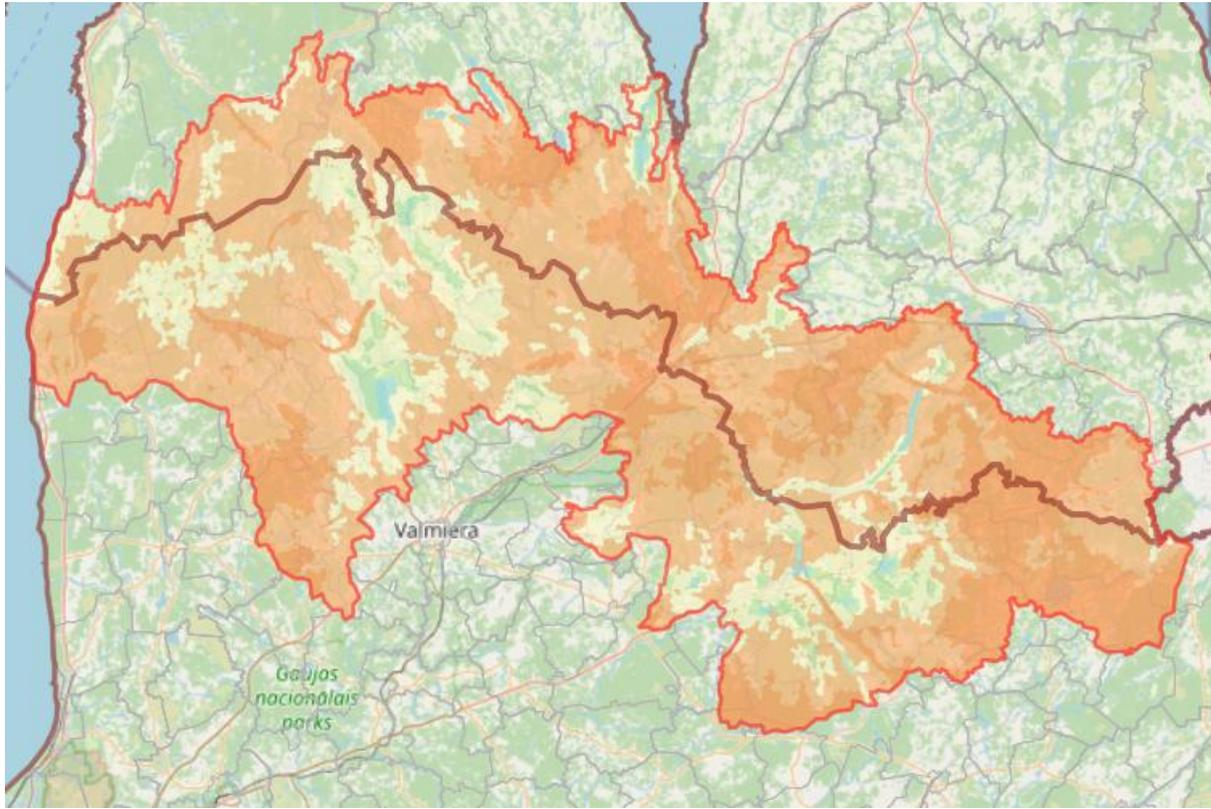

- Attributes

Below are the attributes and vocabularies used to describe the layer "hydrogeological units of the main useful aquifer":

Attribute name	Attribute value
Aquifer	<ul style="list-style-type: none"> <li>• Quaternary aquifer</li> <li>• Devonian Plavinas-Ogre aquifer system</li> <li>• Devonian Aruküla-Amata aquifer system</li> </ul>
Lithology of aquifer	<ul style="list-style-type: none"> <li>• sandstone with siltstone interlayers</li> <li>• dolomite with dolomitic marl</li> </ul>
Stratigraphy of the dominating sediments	<ul style="list-style-type: none"> <li>• Q</li> <li>• Dpl-og</li> <li>• Dar-am</li> <li>• Dpl-og</li> <li>• Dar-am</li> </ul>
Aquifer type	<ul style="list-style-type: none"> <li>• Terrigenous</li> <li>• Fractured</li> <li>• Fractured-cavernous</li> </ul>

### 3.2. Depth to the main useful aquifer

- Map appearance

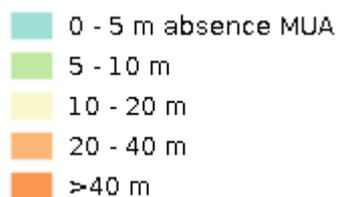

- Definition

The depth to main useful aquifer (MUA) is defined depending on the nature of the MUA water table as the depth from the ground surface to:

- MUA unconfined groundwater table,
- MUA confined groundwater table (that is, to impermeable / semi-permeable deposits limiting the MUA from the top).

- Legend

The "Depth to main useful aquifer" layer is shown in a pixel map. The blue color indicates the depth of 0-5 m, and the dark orange color indicates the greatest value of the depth to the MUA (>40 m).

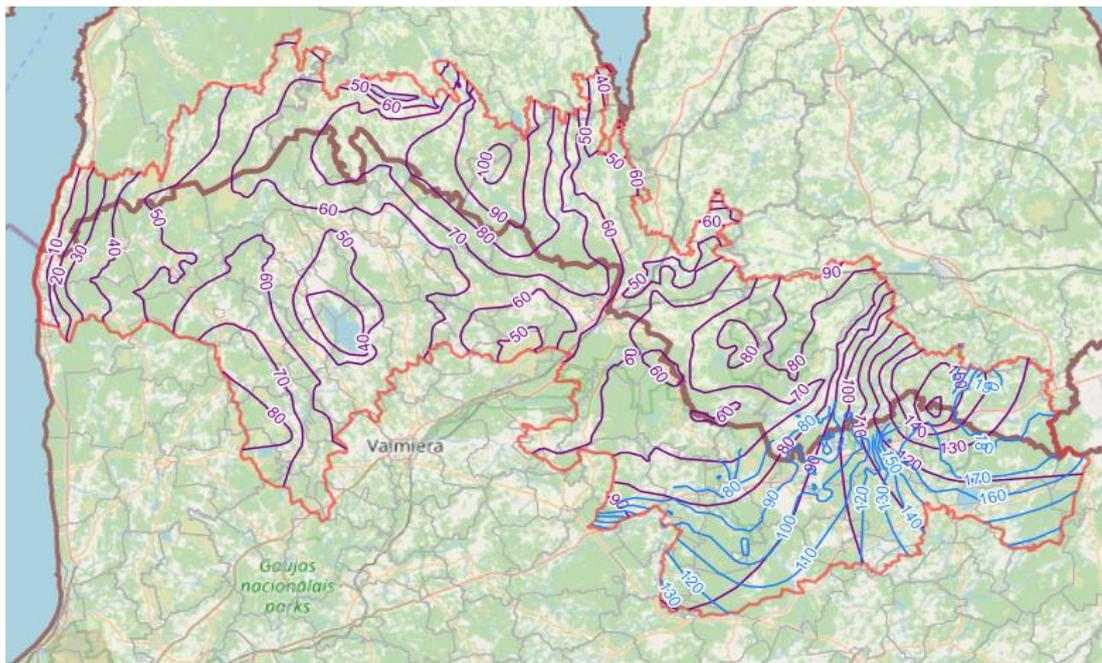

- Attributes

Below are the attributes and vocabularies used to describe the " Depth to main useful aquifer ":

Attribute name	Attribute value
Depth from (m)	<ul style="list-style-type: none"> <li>• 0</li> <li>• 5</li> <li>• 10</li> <li>• 20</li> <li>• 40</li> </ul>
Depth to (m)	<ul style="list-style-type: none"> <li>• 5</li> <li>• 10</li> <li>• 20</li> <li>• 40</li> <li>• &gt; 40</li> </ul>

### 3.3. Hydroisohypses of the main useful aquifer

- Map appearance

- Definition

**Hydroisohypses** – Contour lines for connecting equal level groundwater head points of the main useful aquifer.

- Legend

The "Hydroisohypses of the main useful aquifer" are shown on the map as purple lines. Certain hydroisohypses have been defined as solid lines. On the other hand, the uncertain hydroisohypses - as dashed lines in areas devoid of the main usable aquifer (MUA). Each hydroisohypse was assigned a numerical value, and subsequent hydroisohypses are cut every 10 m.

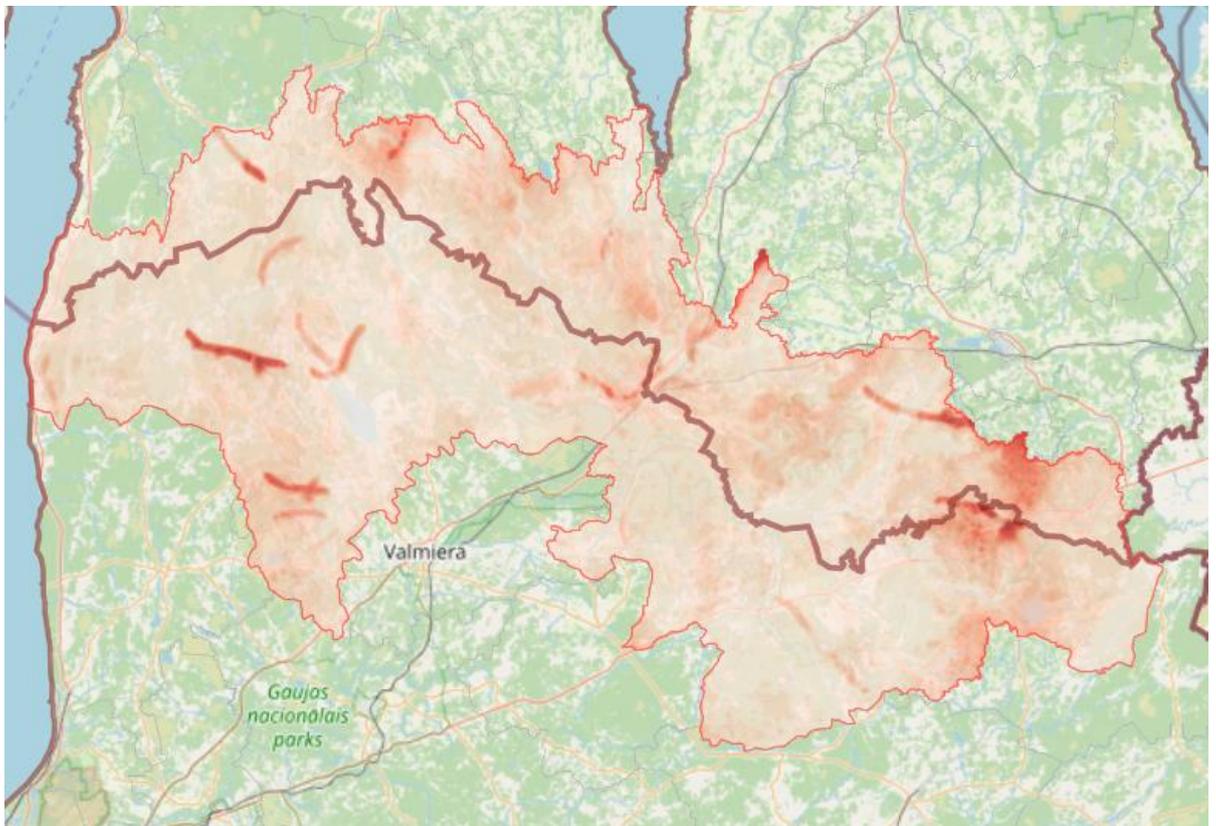

- Attributes

Below are the attributes and vocabularies used to describe the "Hydroisohypse of the main useful aquifer".

Attribute name	Attribute value
Value (m)	Intervals of isolines of the water head every 10 m

### 3.4. Thickness of the impermeable layer over main useful aquifer

- Map appearance

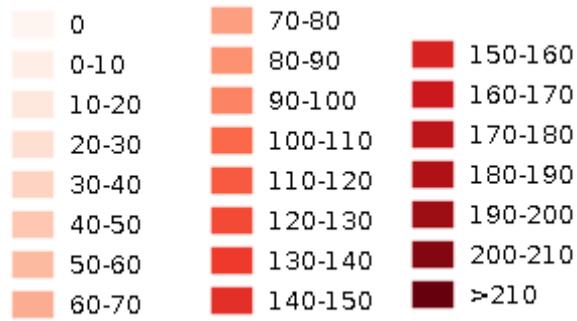

- Definition

The layer contains polygons for the thickness of the impermeable layer over main useful aquifer.

- Legend

The "Thickness of the impermeable layer" is shown in a pixel map. The colors indicate the thickness, the darker the color, the thicker the layer over the main useful aquifer.

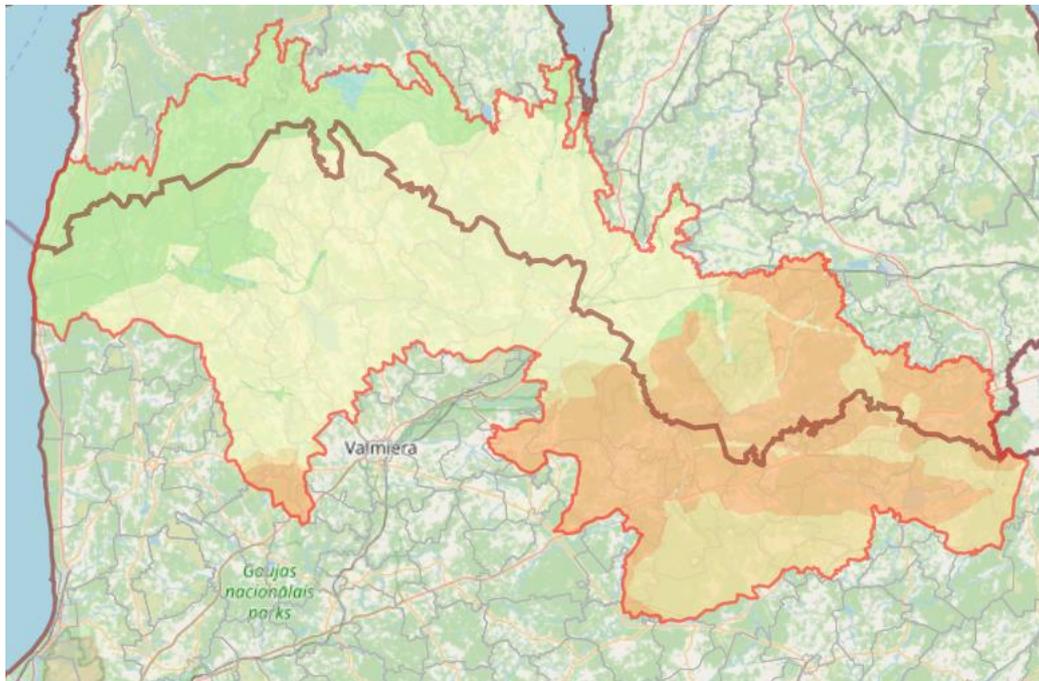

- Attributes

Attribute name	Attribute value
Intervals of the thickness of the impermeable layer	<ul style="list-style-type: none"> <li>• Intervals of the thickness of the impermeable layer in every 10 m</li> </ul>

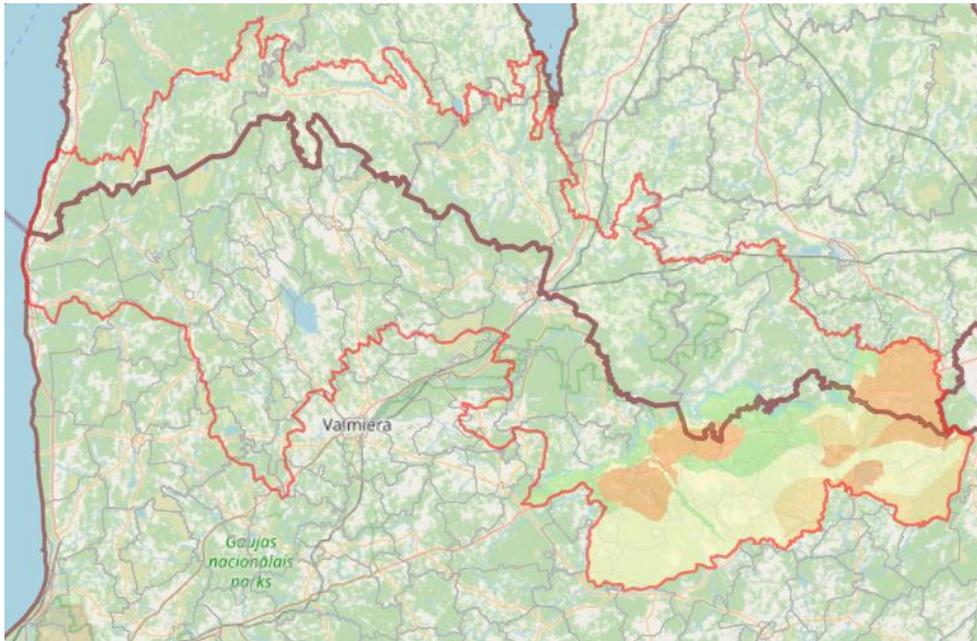

### 3.5. Transmissivity of the main useful aquifer

- Map appearance

Transmissivity of the Dar-am aquifer

### Transmissivity of the *Dpl-og* aquifer

- Definition

Transmissivity of the MUA - the rate at which water of the prevailing kinematic viscosity is transmitted through a unit width of the aquifer under a unit hydraulic gradient. It is equal to an integration of the hydraulic conductivities across the saturated part of the aquifer perpendicular to the flow paths.

- Legend

The "Transmissivity of the main usable aquifer" layer is shown on a pixel map. The blue color indicates a conductivity of 0-2 m<sup>2</sup>/day and the dark orange color indicates the highest conductivity value of MUA (>500 m<sup>2</sup>/day).

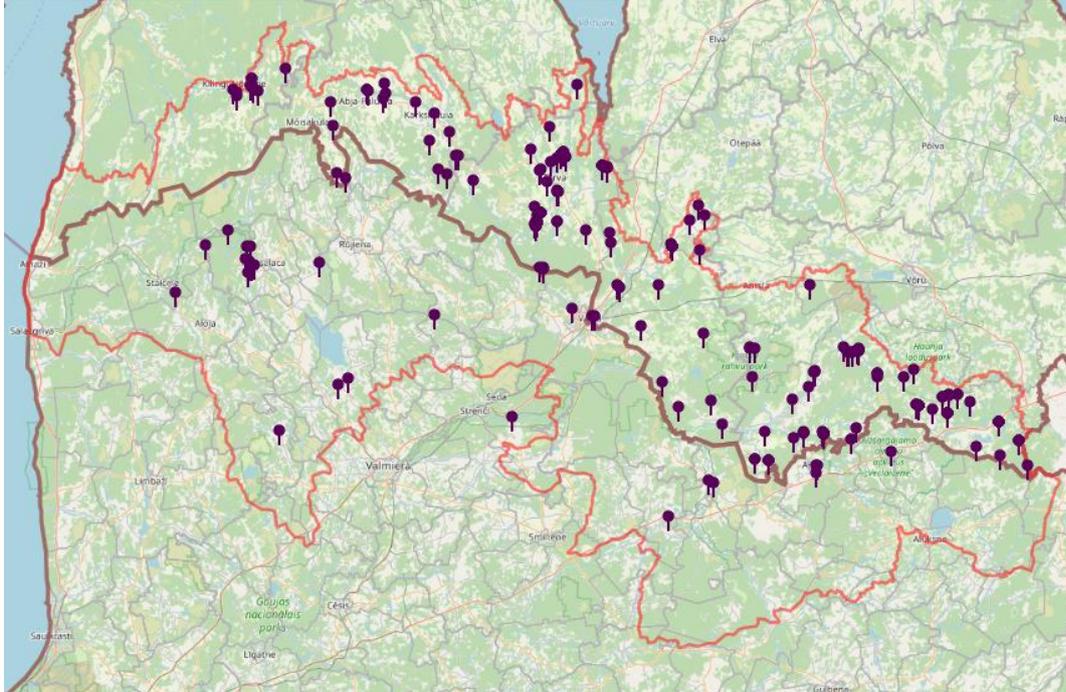

- Attributes

Below are the attributes and vocabularies used to describe the "Transmissivity of the main useful aquifer":

Attribute name	Attribute value
Intervals of the transmissivity of the main useful aquifer	<ul style="list-style-type: none"> <li>• 0–2 m<sup>2</sup>/d</li> <li>• 2–100 m<sup>2</sup>/d</li> <li>• 100–200 m<sup>2</sup>/d</li> <li>• 200–500 m<sup>2</sup>/d</li> <li>• &gt; 500 m<sup>2</sup>/d</li> </ul>

### 3.6. Springs

- Map appearance

- Definition

Natural, concentrated outflow of groundwater on the ground surface.

- Legend

the symbol marks the spring on the map

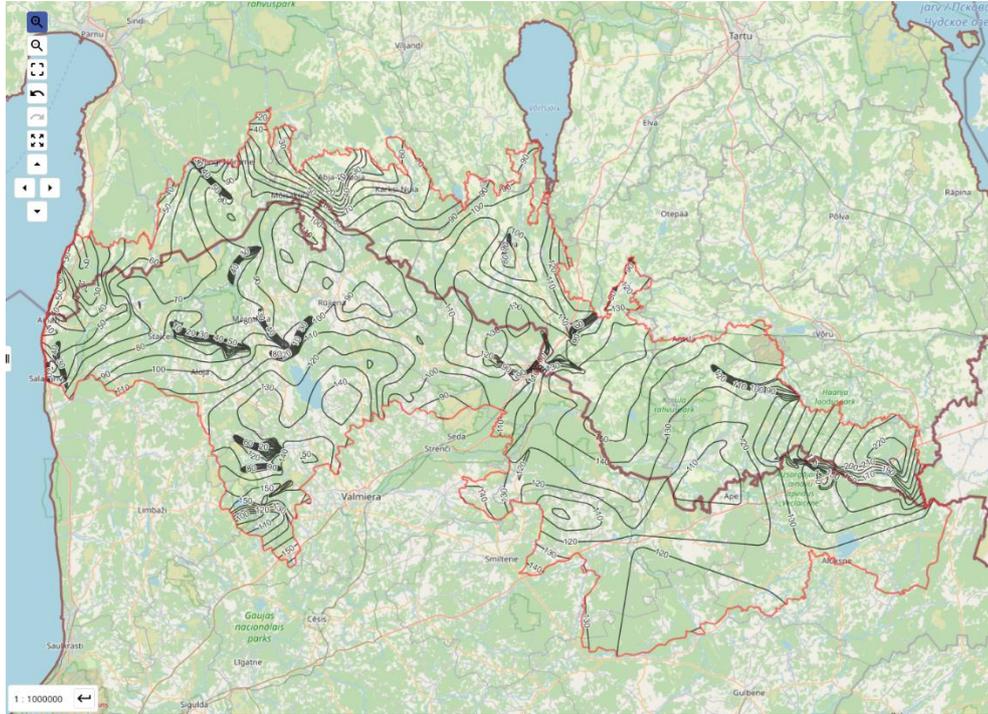

- Attributes

Below are the attributes and vocabularies used to describe the "Springs" layer:

Attribute name	Attribute value
Terrain elevation (m a.s.l.)	• Elevation in m a.s.l
Stratigraphy of aquifer	• Q / Dpl-og / Dar-am / Dar-am and Dpl-og
Flow rate (l/s)	• Flow rate in l/s
Name	• Name of the spring
Attachment	• Link to spring database

### 3.7. Thickness of the main useful aquifer

- Map appearance

- Definition

Thickness of the main useful aquifer, measured between its top and bottom.

- Legend

The "Thickness of the main useful aquifer" layer is shown as black polylines indicating the intervals of the thickness.

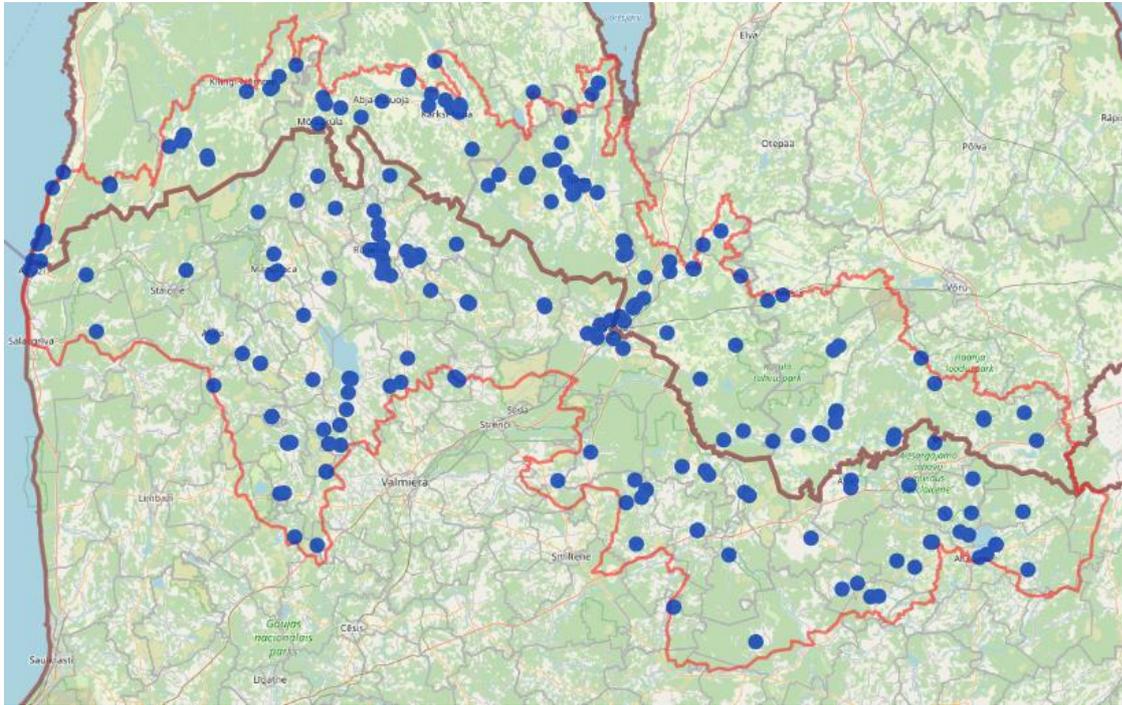

- Attributes

Below are the attributes and vocabularies used to describe the layer "Thickness of the main useful aquifer".

Attribute name	Attribute value
Thickness of MUA from (m)	<ul style="list-style-type: none"> <li>• 0</li> <li>• 2</li> <li>• 10</li> <li>• 20</li> <li>• 40</li> </ul>
Thickness of MUA to (m)	<ul style="list-style-type: none"> <li>• 2</li> <li>• 10</li> <li>• 20</li> <li>• 40</li> <li>• &gt; 40</li> </ul>

### 3.8. Wells / Boreholes

- Map appearance

- Definition

A borehole made to determine the hydrogeological conditions, groundwater exploitation, observation, etc.

- Legend

● the symbol marks a well/borehole on the map

- Attributes

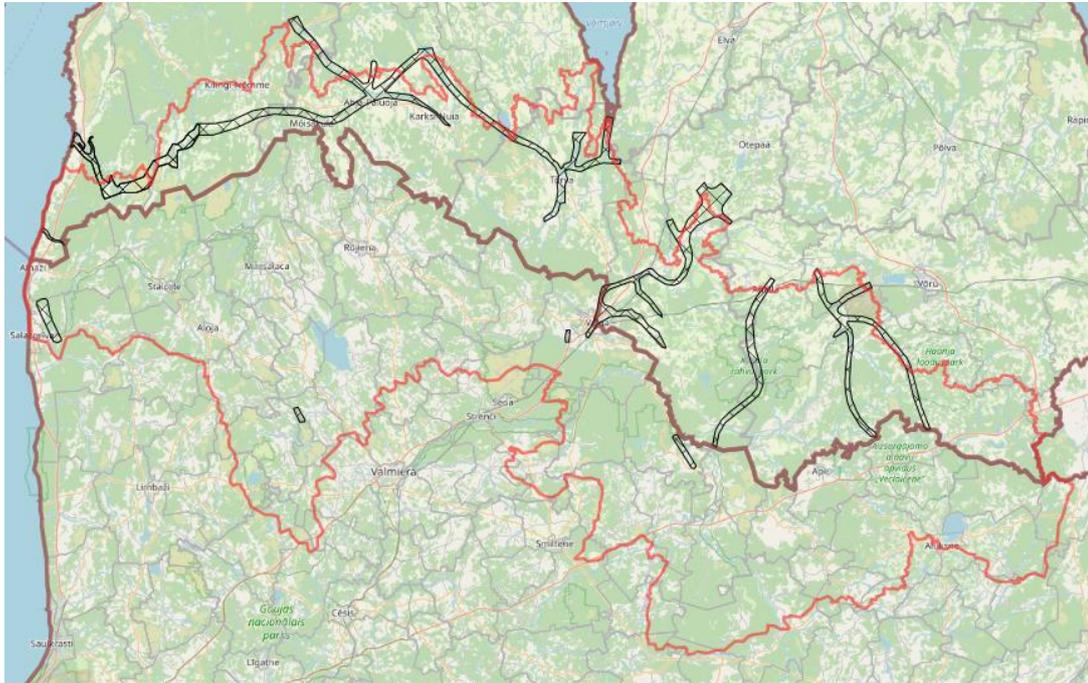

Below are the attributes and vocabularies used to describe the "Wells/Boreholes" layer:

Attribute name	Attribute value
Type of borehole	<ul style="list-style-type: none"> <li>• research well</li> <li>• exploitation well</li> </ul>
Terrain elevation	<ul style="list-style-type: none"> <li>• value in m a.s.l.</li> </ul>
Year when the borehole was made	<ul style="list-style-type: none"> <li>• Year</li> </ul>
Borehole depth	<ul style="list-style-type: none"> <li>• value in m b.g.l.</li> </ul>
The depth of the static groundwater level	<ul style="list-style-type: none"> <li>• value in m b.g.l.</li> </ul>
Groundwater level	<ul style="list-style-type: none"> <li>• value in m a.s.l.</li> </ul>

### 3.10. Buried valleys

- Map appearance

- Definition

Area layer showing valleys filled with different sediments.

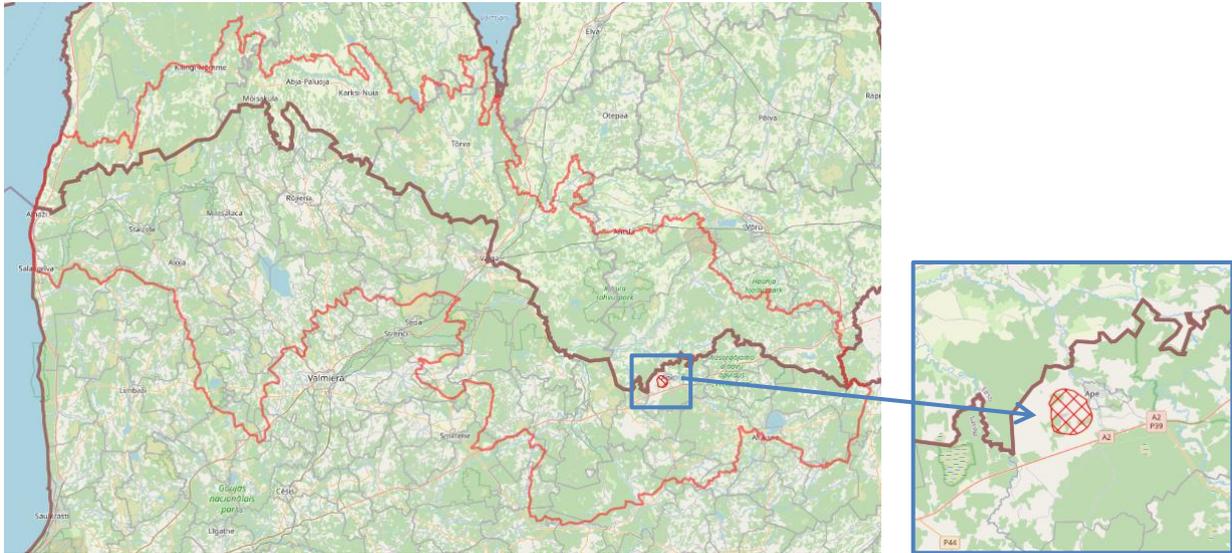

- Legend

the symbol marks a buried valley on the map

### 3.11. Areas of depression cones

- Map appearance

- Definition

Zone of lowering the piezometric surface (groundwater table) caused by pumping or drainage of aquifers by intakes, mines, etc. Depression of regional importance, with an area of more than 50 km<sup>2</sup> or smaller ones with a mirror depression of more than 50 m.

- Legend

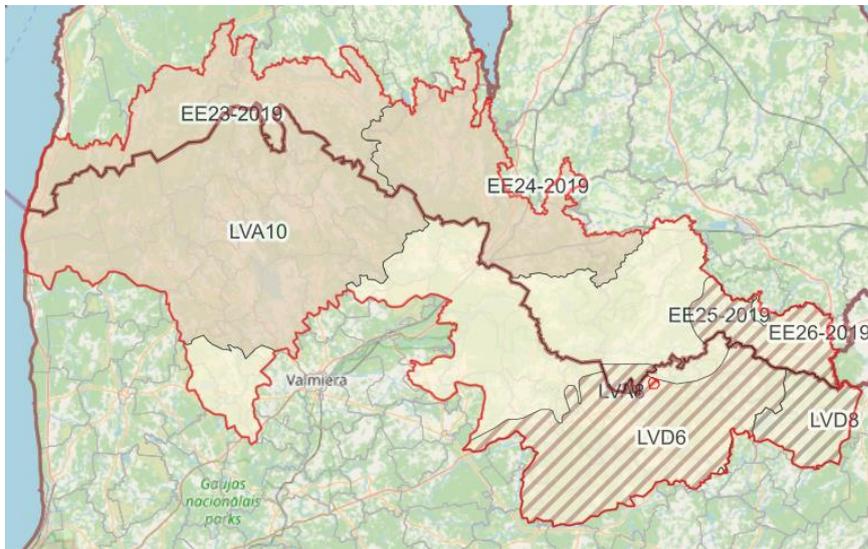

the symbol marks an area of depression cone on the map

- Attributes

Attribute name	Attribute value
Type of lowering of the groundwater level	<ul style="list-style-type: none"> <li>• Cone from the exploitation of groundwater / Cone from mining drainage / decrease from melioration / decrease from land drainage</li> </ul>
Drainage facility	<ul style="list-style-type: none"> <li>• Name of the facility: water intake, mining plant, etc.</li> </ul>
Depression cone surface	<ul style="list-style-type: none"> <li>• Area in km<sup>2</sup></li> </ul>

### 3.12. Groundwater bodies

- Map appearance

- Definition

According to the definition given in the Water Framework Directive, groundwater bodies (GWB) include groundwater that occur in aquifers with porosity and permeability, enabling a significant uptake in water supply to the population or flow with an intensity significant for shaping the desired state of surface water and terrestrial ecosystems.

- Groundwater bodies - Dpl-og
- Groundwater bodies - Dar-am

GWBs of both Estonia and Latvia are shown and they are divided into Dar-am and Dpl-og.

- Legend

- EE23-201
- EE24-2019
- EE25-2019
- EE26-2019
- LVA10
- LVA8
- LVD6
- LVD8

The GWB layer is represented on the map by colored areas. Each GWB object has a unique fill color and has its own unique code (EU code of GWB), which allows unambiguous identification.

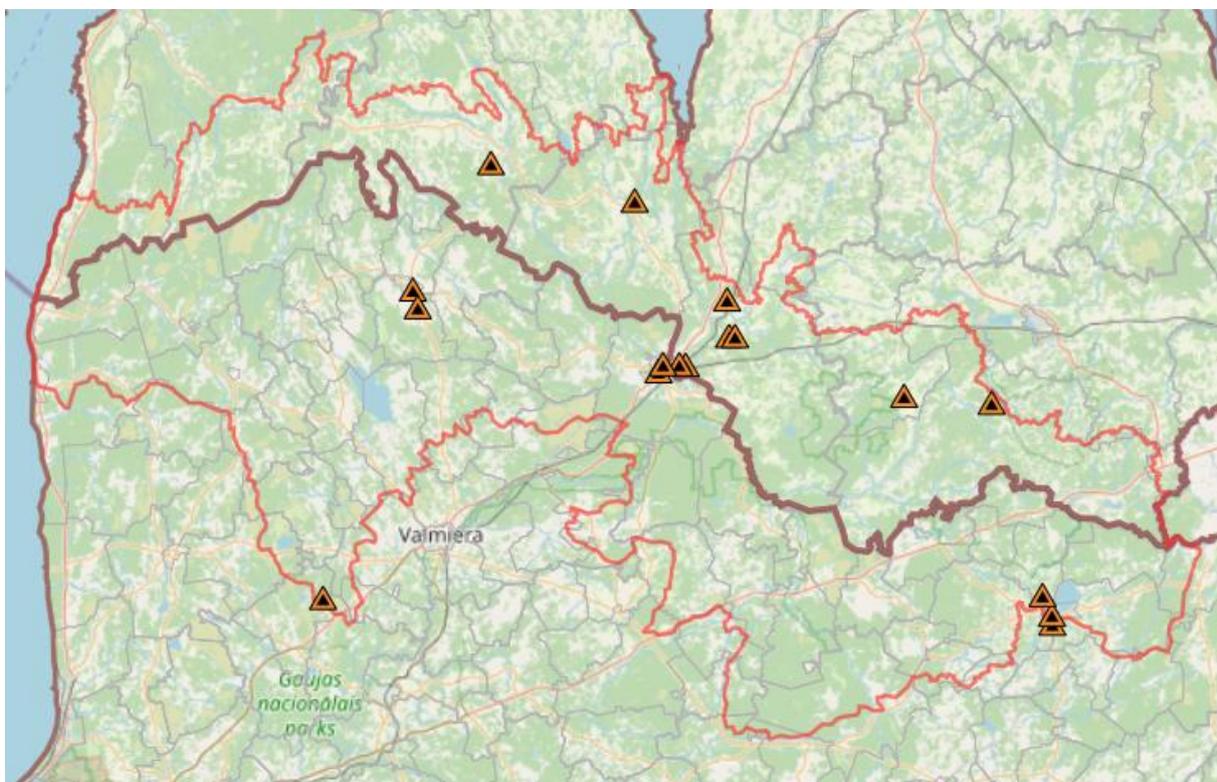

- Attributes

Below are the attributes and vocabularies used to describe the groundwater bodies layer.

Attribute name	Attribute value
European code of GWB	EU code of GWB
Area of GWB	Area in km <sup>2</sup>
River basin	Name of the river basin
Main River	Name of the main River Basin
Stratigraphy of the MUA	Q+Dar-am / Q+Dpl-og /Dar-am and Dpl-og
Dominant chemical type of MUA waters	Natural type (HCO <sub>3</sub> -Ca) / A type deviating from the natural (HCO <sub>3</sub> -SO <sub>4</sub> -Cl-Ca)
Threat of pressures	Yes / No
WFD pressure types	Point / Diffuse / Anthropogenic pressure – Other / Anthropogenic pressure – Unknown / Anthropogenic pressure – Historical pollution
Area of groundwater dependent ecosystems (ha)	Area in ha
Area of protected areas (ha)	Area in ha
Diffuse pollution areas	areas prone to nitrate pollution from agriculture  urban area  none
Assessment of the quantitative status of GWB	good  poor
Assessment of the chemical status of GWB	good  poor
Overall assessment of the state of the GWB	good  poor
Year of the most recent GWB assessment	Year of last assessment
Risk assessment of failure to achieve environmental goals	Endangered / not endangered

### 3.13. Groundwater pollution sites

- Map appearance

- Definition

**Groundwater pollution source** - an object causing intentional or accidental release of undesirable substances into groundwater as a result of anthropogenic activity or for natural causes.

For both the Estonian and Latvian side of the transboundary area, spatial data prepared for RBMP (Pressure types in WFD Reporting Guidance 2022) was used for this parameter and attribute table modified according to the attributes required for this parameter.

- Legend

the symbol indicates the place of groundwater pollution

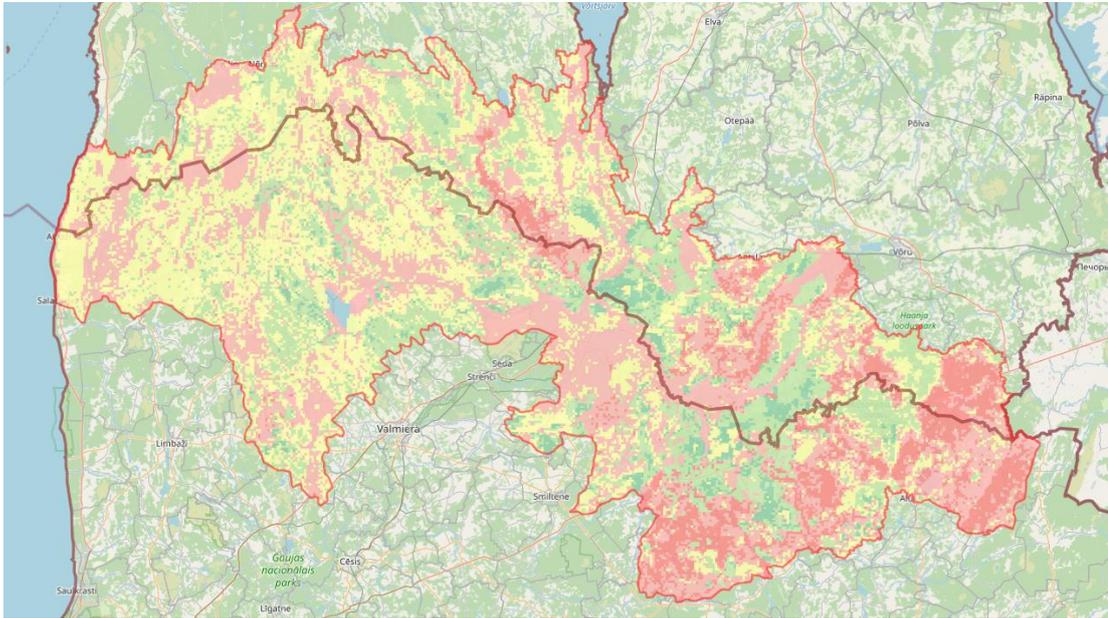

- Attributes

Below are the attributes and vocabularies used to describe the Groundwater pollution site layer.

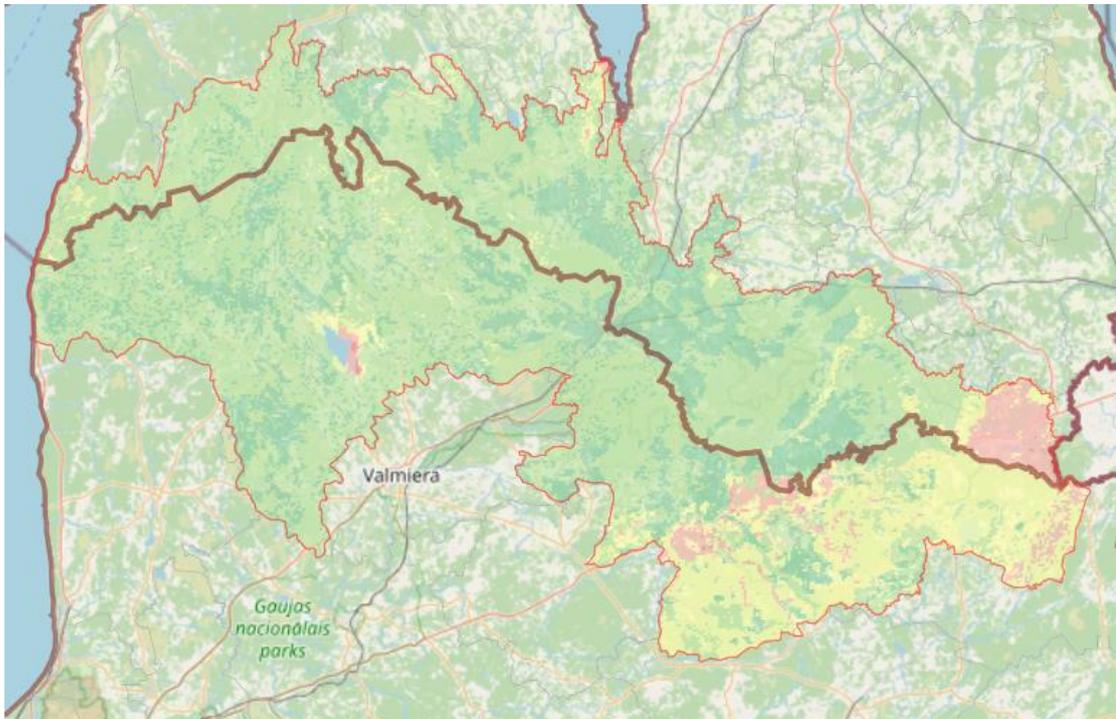

Attribute name	Attribute value
Pressure type	Pressure type from WFD Reporting Guidance

### 3.14. Vulnerability to groundwater pollution

- Map appearance – vulnerability of the Quaternary aquifer

- Map appearance – vulnerability of the main useful aquifer

- Definition

Groundwater vulnerability is based on the concept that the natural environment provides protection to groundwater. The protection provided by different (hydro)geological conditions varies from one place to another.

- Legend

- Unprotected
- Weakly protected
- Moderately protected
- Relatively well protected
- Well protected
- Absence of MUA

The "Groundwater Vulnerability to Pollution" layer is represented by a pixel map. Red means very high susceptibility to groundwater pollution, and dark green means very low susceptibility to groundwater pollution. Areas where there are no hydrogeological units of the main usable aquifer were filled with a red grid.

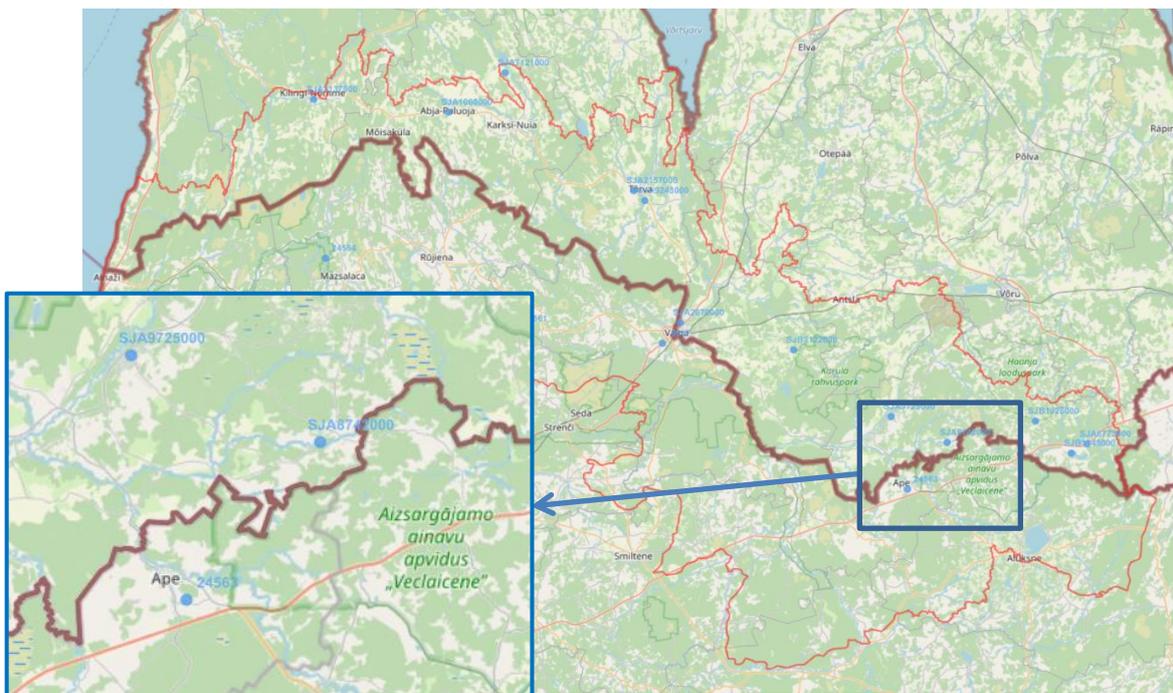

- Attributes:

Below are the attributes and vocabularies used to describe the "Groundwater Vulnerability to Pollution " layer.

Attribute name	Attribute value
Vulnerability class	<ul style="list-style-type: none"> <li>• Unprotected</li> <li>• Weakly protected</li> <li>• Moderately protected</li> <li>• Relatively well protected</li> <li>• Well protected</li> </ul>

### 3.15. Groundwater monitoring points

- Map appearance

Definition

**Groundwater monitoring point** - A station with appropriate devices for measuring and sampling groundwater for repeated hydrogeological observations carried out over a longer period.

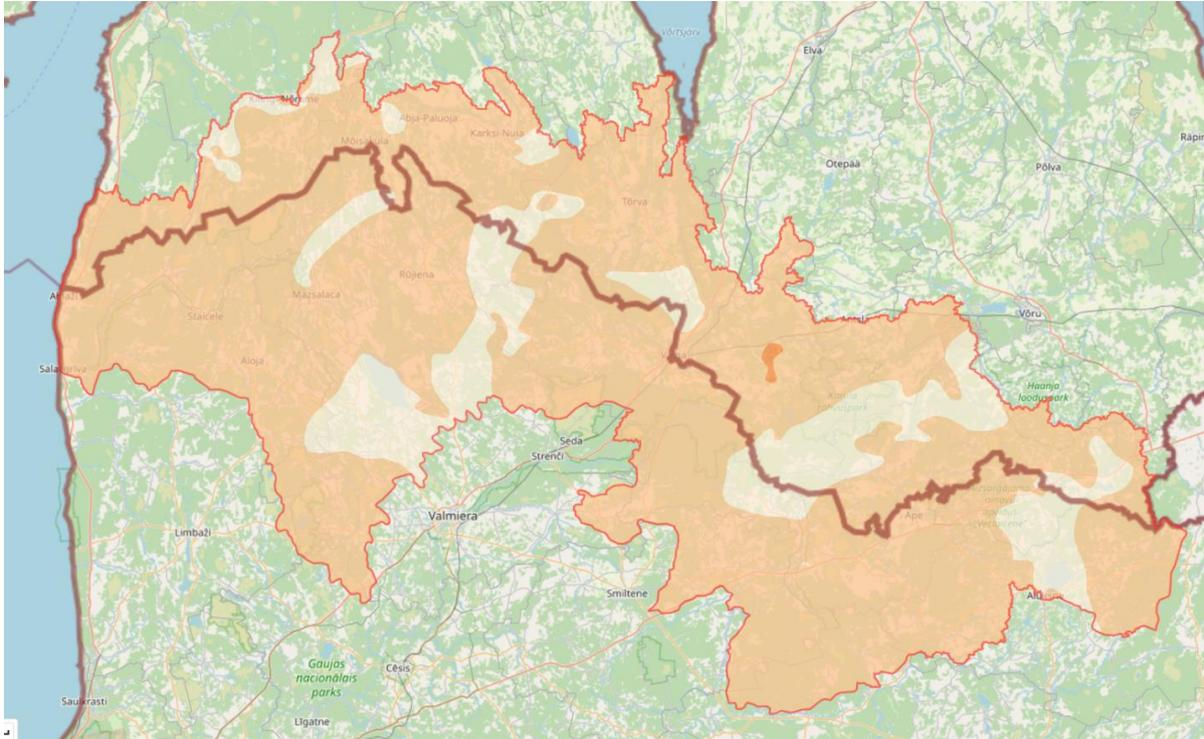

- Legend:
- the symbol indicates the location of the groundwater monitoring point
- Attributes:

Below are the attributes and vocabularies used to describe the „Groundwater monitoring points” layer.

Attribute name	Attribute value
Point National Number	National point number
WFD code	International code (WFD)
Point Type	<ul style="list-style-type: none"> <li>• piezometer</li> <li>• well</li> <li>• spring</li> </ul>
Groundwater level type	<ul style="list-style-type: none"> <li>• unconfined</li> <li>• confined</li> <li>• spring</li> </ul>
Terrain elevation	Value in m a.s.l.
Year of starting observations	Year
Type of monitoring	<ul style="list-style-type: none"> <li>• quantitative/chemical</li> <li>• quantitative</li> </ul>
Depth of observation well	Depth in m b.g.l.
The depth of the screen from	Depth in m b.g.l.
The depth of the screen to	Depth in m b.g.l.
Stratigraphy of the aquifer	<ul style="list-style-type: none"> <li>• Q</li> <li>• Dar-am</li> <li>• Dpl-og</li> <li>• Dar-am and Dpl-og</li> </ul>
The depth of the drilled groundwater level	Depth in m b.g.l
The depth of the stabilized groundwater level	Depth in m b.g.l
Groundwater level	m a.s.l

### 3.16. Groundwater mineralization for main useful aquifer

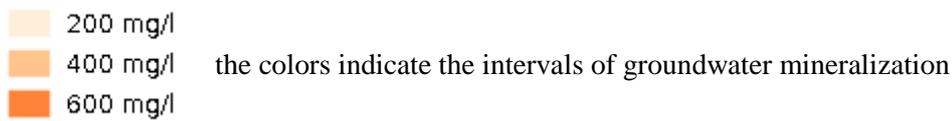

- Map appearance

- Definition

Values of the mineralization in groundwater in the main useful aquifer, displayed by polygons for both the Dpl-og and Dar-am aquifers.

- Legend

- Attributes

Attribute name	Attribute value
Intervals of isolines of mineralization	<ul style="list-style-type: none"> <li>• 200 mg/l, 400 mg/l, 600 mg/l</li> </ul>

## 4. Legend

- Administration - Estonia ~ ⓘ ...
- Basemap ~ ...

**Add group** - this feature allows you to create a group of layers yourself from the existing ones or adding a new layer in the form of a WMS or WMTS service to the group. After pressing the "add group" button, a window appears for entering the name of the group you want to add. Then enter the name of the group and confirm with the "add" button. We can add layers to the created group by hovering the cursor over the selected layer, pressing the right mouse button and dragging it to the created group.

Add group

Group name \*

CANCEL ADD

**Add layer** - the tool is used to add a new information layer to the map in the form of a WMS or WMTS service.

Add layer

BASIC OPTIONS      ADVANCED OPTIONS

---

Service type:  
 WMS    WMTS

Source:  
 URL \* GET LAYERS

Layer options:  
 Swap axes  
 Layer name \*

Group options:  
 Create new group    Add to existing group  
 Group name \*

CANCEL ADD

To add a new information layer to the map in the form of a WMS or WMTS service, use the "add layer" button, select the WMS or WMTS service type in the "basic options" tab, then enter the service address and press the "download layer" button. In the layer options, you can check or uncheck the "swap axes" function and give the added layer a name. You can also use the "group options" tool, which allows you to choose one of two functions:

- creating a new group,
- adding to an existing group.

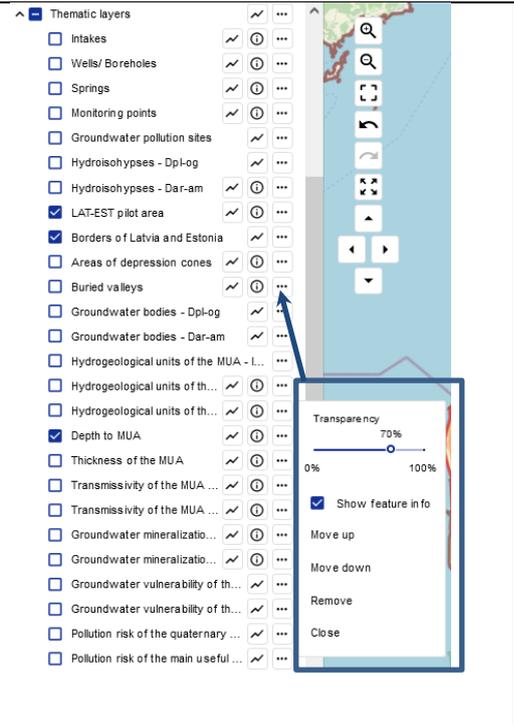

If you select the "create a new group" option, enter the name of the newly created group in the window below this function. However, if you select the "add to an existing group" option, enter the name of one of the existing groups in the window.

In the advanced options in the "translation" tab, we can also complete information about the layer by adding its name and description in English, Polish and Ukrainian.

You can also manage the "Legend" tab using the options available for individual layers or groups consisting of several layers:

- ✓  Cross sections  
- ✓  Thematic layers  
- ✓  Administration - Latvia   
- ✓  Administration - Estonia   
- ✓  Basemap 

The "legend" tab displays the layers that make up the map composition. Unchecking the name of a layer or layer group disables the visibility of the layer/layer group on the map. After the name of the layer or group of layers, there are function buttons that allow you to control the order and visibility of individual layers, and displaying the definition of the selected layer. A detailed description of the tools used is presented below:

	<p><b>Show map composition style</b> - pressing the button displays a new window with the symbols used on the map and their description.</p>
	<p><b>Show info about layer group</b> - pressing the button opens a window in which the definition of the selected layer is displayed.</p>
	<p><b>More actions</b> - pressing the button launches a window in which we can select from 4 to 6 functions that allow you to manage the visibility and create your own map compositions.</p> <p>The following features are available:</p> <p><b>Transparency</b> - allows you to set the transparency of the layer by moving the slider.</p> <p><b>Show feature info</b> - unchecking the check box in front of the layer or layer group name disables the visibility of information about objects. If the checkbox is selected, then after moving the cursor over the selected object from the displayed layer, you can use the left mouse button to open the window with the attributes of the selected object.</p> <p><b>Move up</b> - moves the layer up relative to other layers in the map composition.</p> <p><b>Move down</b> - moves the layer down relative to other layers in the map composition.</p> <p><b>Remove</b> - the tool allows you to delete layers.</p> <p><b>Close</b> - closes the window</p>

<p>▼</p> <p>▲</p>	<p>Expand the layer group</p> <p>Collapse the layer group</p>
<p><input checked="" type="checkbox"/></p> <p><input type="checkbox"/></p> <p><input checked="" type="checkbox"/></p>	<p>Check/uncheck boxes - Enable/disable layer visibility</p> <p><input checked="" type="checkbox"/> Make the layer visible</p> <p><input type="checkbox"/> Make the layer invisible</p> <p><input checked="" type="checkbox"/> There are visible and invisible layers in the group of shapes</p>

### Tabs in the Legend menu

The Legend menu is presented in 5 groups of data:

- ▼  Cross sections
- ▼  Thematic layers
- ▼  Administration - Latvia
- ▼  Administration - Estonia
- ▼  Basemap

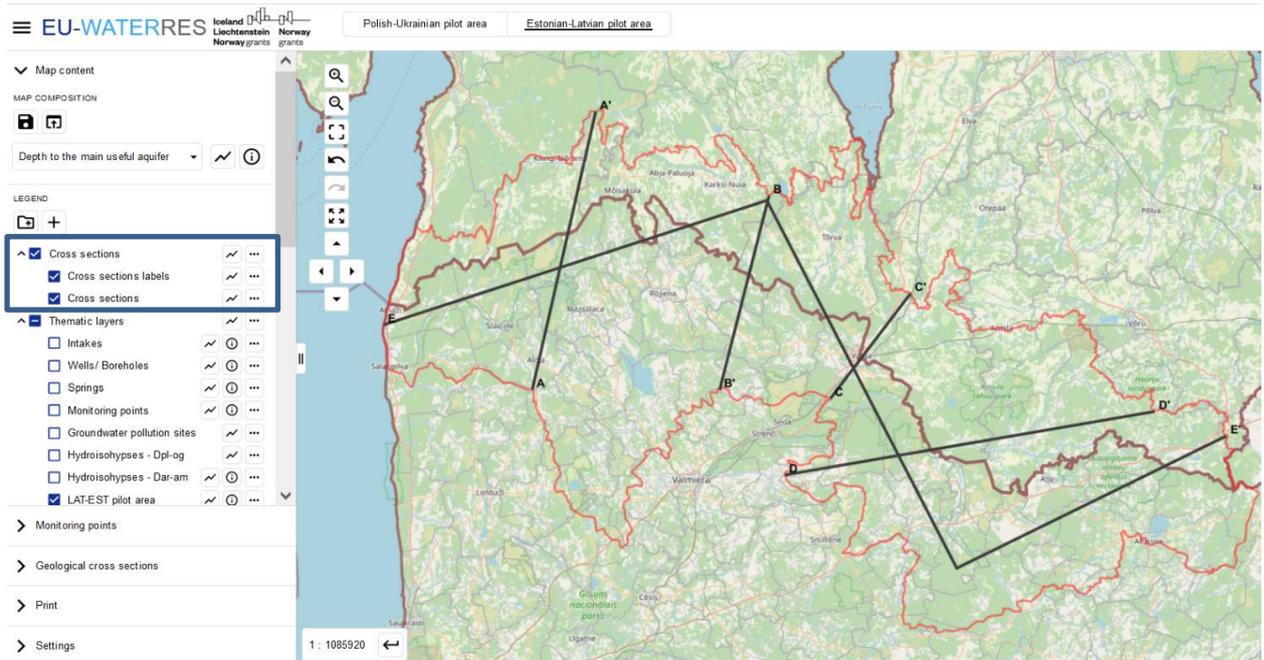

Each of them has been discussed:

#### 4.1. Cross-sections

The “Cross sections” tab consists of two layers:

- „Cross sections – labels” – are the labels for the section lines;
- „Cross sections” – are the sections lines.

By selecting the "Cross sections" and "Cross sections - labels" checkboxes, lines of geological cross-sections and their descriptions will appear on the map.

- Definition:

The hydrogeological cross-section is a graphic representation of the hydrogeological conditions along the selected vertical plane due to the geological structure.

- Legend:

The line on the map represents the cross-section line

- Attributes:

Attribute name	Attribute value
Name	Name of cross section: AA" BB" CC" DD" EE"
Length (km) Cross section	Length of the cross-section in km Represented by an icon, after clicking which the user is redirected to a new browser tab, where a geological cross-section is displayed in *.jpg format.

#### 4.2. Thematic layers

- Thematic layers
- Intakes
- Wells/ Boreholes
- Springs
- Monitoring points
- Groundwater pollution sites
- Hydroisohypses - Dpl-og
- Hydroisohypses - Dar-am
- LAT-EST pilot area
- Borders of Latvia and Estonia
- Areas of depression cones
- Buried valleys
- Groundwater bodies - Dpl-og
- Groundwater bodies - Dar-am
- Hydrogeological units of the MUA - labels
- Hydrogeological units of the MUA - Dpl-og
- Hydrogeological units of the MUA - Dar-am
- Depth to MUA
- Thickness of the MUA
- Transmissivity of the MUA - Dpl-og
- Transmissivity of the MUA - Dar-am
- Groundwater mineralization for MUA Dpl-og
- Groundwater mineralization for MUA Dar-am
- Groundwater vulnerability of the quaternary aquifer
- Groundwater vulnerability of the main useful aquifer
- Pollution risk of the quaternary aquifer
- Pollution risk of the main useful aquifer

Most of the layers in the "Thematic layers" tab have been described in the "Map composition" chapter. Here, the focus is on those that are not included in this list, namely:

- LAT-EST pilot area;
- Borders of Latvia and Estonia;
- Pollution risk of the quaternary aquifer;
- Pollution risk of the main useful aquifer.

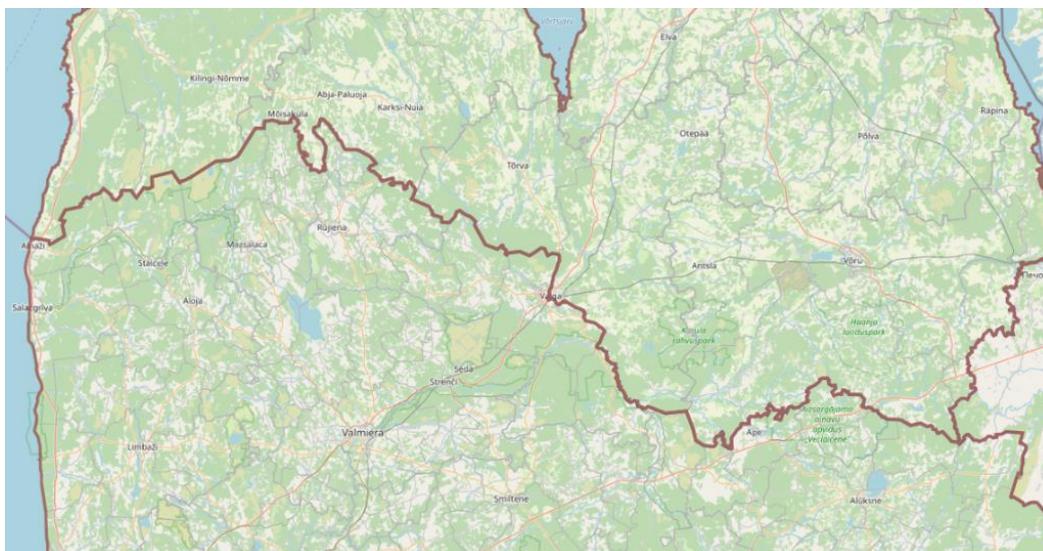

#### 4.2.1. LAT-EST pilot area

This layer is the contour of the Latvian-Estonian area of pilot research. Within this contour, thematic maps were made.

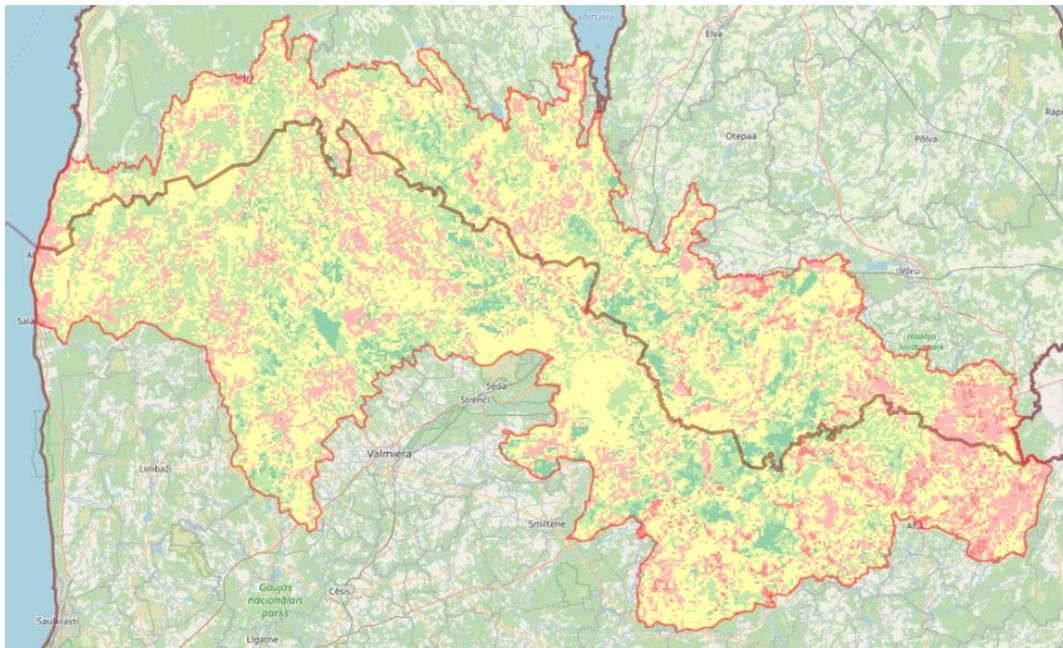

#### 4.2.2. State border

This layer is the state border between Latvia and Estonia.

#### 4.2.3. Pollution risk of Quaternary aquifer

The layer of developed pollution risk map for Quaternary aquifer

- Legend:

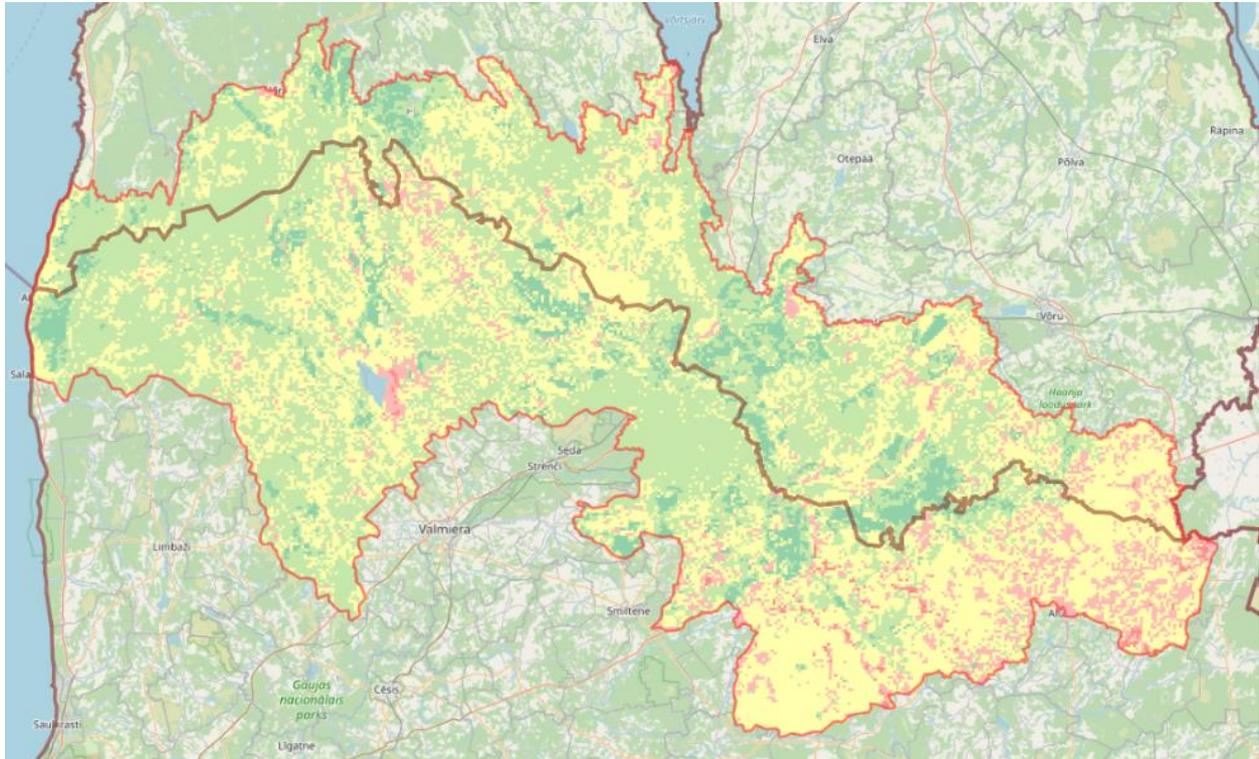

- Very high risk
- High risk
- Medium risk
- Low risk
- Very low risk
- ✕ Absence of MUA

- Attributes:

The map shows areas with potential pollution risk. Map is classified into 5 risk classes - from very low risk to very high risk of pollution.

#### 4.2.4. Pollution risk of main useful aquifer

The layer of developed pollution risk map for main useful aquifer

- Legend:

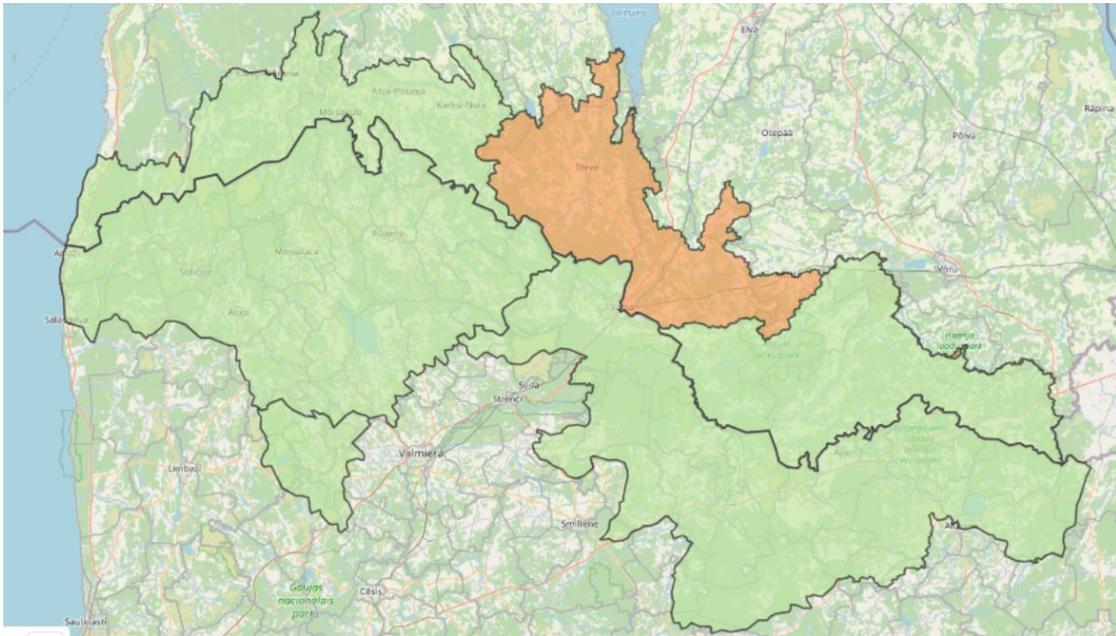

- Very high risk
- High risk
- Medium risk
- Low risk
- Very low risk
- ✕ Absence of MUA

- Attributes:

The map shows areas with potential pollution risk. Map is classified into 5 risk classes - from very low risk to very high risk of pollution.

#### 4.2.5. State of groundwater bodies

The layer “State of groundwater bodies” will be visible only if you choose a “Groundwater bodies” layer in Map composition section.

- Definition

Assessment of the quantitative status of groundwater bodies.

- State of groundwater bodies ↗ ...
- Quantitative state of GWB - Dpl-og ↗ ⓘ ...
- Quantitative state of GWB - Dar-am ↗ ⓘ ...
- Qualitive state of GWB - Dpl-og ↗ ⓘ ...
- Qualitive state of GWB - Dar-am ↗ ⓘ ...

Quantitative and qualitative status of groundwater bodies are shown and they are divided into Dar-am and Dpl-og aquifers

- Legend

The "State of groundwater bodies" layer is shown on a polygon map. The green color indicates a groundwater bodies which are at good status. Orange color indicates a groundwater body which are at poor status

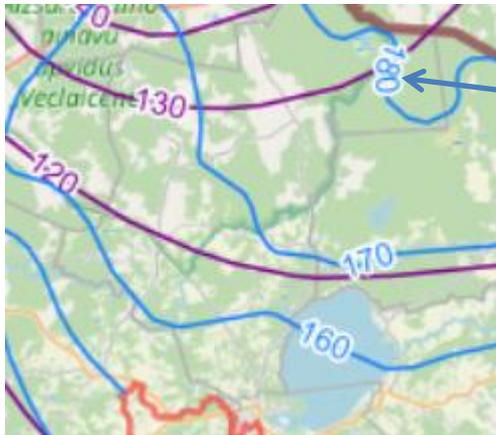

- Poor
- Good

- Attributes

Attributes are the same as thematic layer “Groundwater bodies”

#### 4.2.6. Hydroisohypses – labels

This is an auxiliary layer that shows the hydroisohips values on the map. It is advisable to use together with the shape of hydroisohips.

Hydroisohypses - label

Hydroisohypses

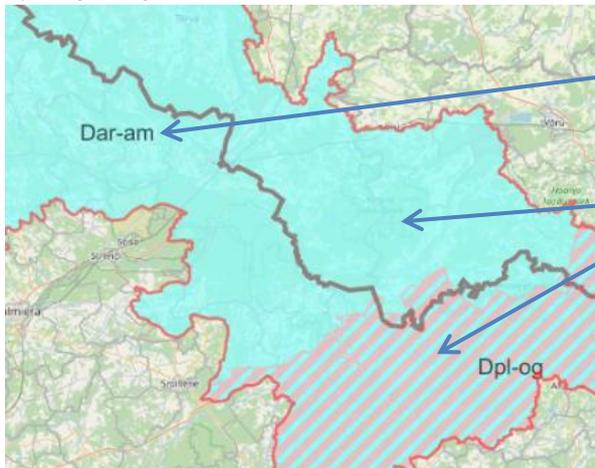

- Dpl-og -
- Dar-am -

Hydroisohypses - Dpl-og

Hydroisohypses - Dar-am

#### 4.2.7. Hydrogeological units of the MUA - labels

This is an auxiliary layer that shows the stratigraphy of the dominant sediments of the MUA hydrogeological units on the map. It is advisable to use the MUA together with the contour/area of the hydrogeological unit.

Symbol of the stratigraphy of the dominant sediments of the MUA hydrogeological unit

Map shows labels of two main useful aquifers:

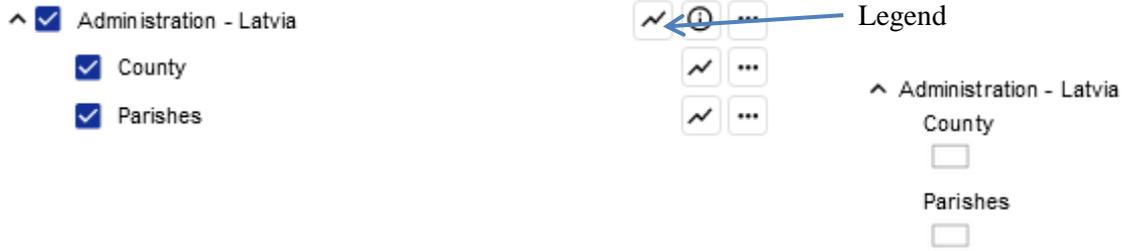

- Dar-am Terrigenous
- Dpl-og Fractured

Layer in MapPortal:

Hydrogeological units of the MUA - labels

### 4.3. Administration – Latvia

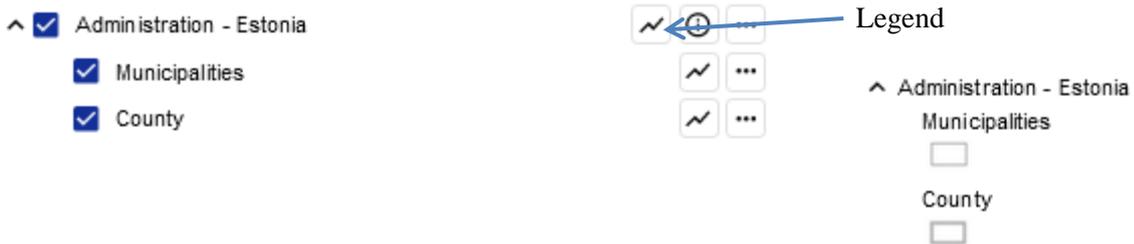

Administrative units of Latvia

Administrative units of Latvia: counties, parishes.

### 4.4. Administration – Estonia

Administrative units of Estonia

Administrative units of Estonia: municipalities, counties.

### 4.5. Base map

OSM (Open Street Map)

<https://www.openstreetmap.org/>

Free online map

## 5. Viewing data in the monitoring points tab

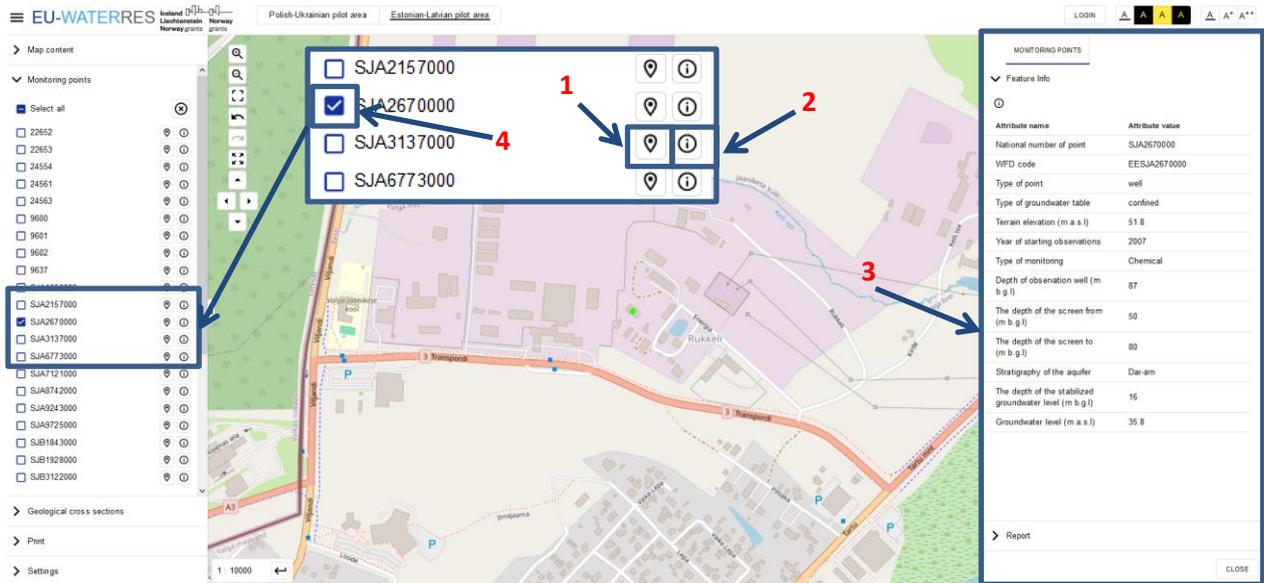

The “Monitoring points” tab contains the following information:

- selection of monitoring point(s);
- quick determination of the location of a specific monitoring point;
- viewing information on the monitoring point;
- creating and printing specifications/characteristics in \*pdf format.

This tab opens the list of monitoring points contained in the "Monitoring points" layer.

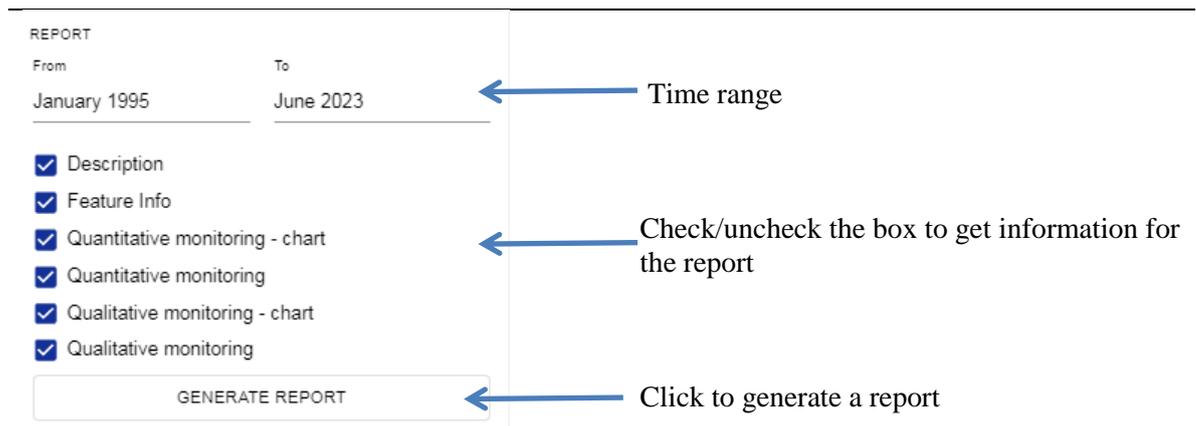

### ▼ Monitoring points

<input type="checkbox"/> Select all	
<input type="checkbox"/> 22652	 
<input type="checkbox"/> 22653	 
<input type="checkbox"/> 24554	 
<input type="checkbox"/> 24561	 
<input type="checkbox"/> 24563	 
<input type="checkbox"/> 9600	 
<input type="checkbox"/> 9601	 
<input type="checkbox"/> 9602	 
<input type="checkbox"/> 9637	 
<input type="checkbox"/> SJA1060000	 
<input type="checkbox"/> SJA2157000	 
<input type="checkbox"/> SJA2670000	 
<input type="checkbox"/> SJA3137000	 
<input type="checkbox"/> SJA6773000	 
<input type="checkbox"/> SJA7121000	 
<input type="checkbox"/> SJA8742000	 
<input type="checkbox"/> SJA9243000	 
<input type="checkbox"/> SJA9725000	 
<input type="checkbox"/> SJB1843000	 
<input type="checkbox"/> SJB1928000	 
<input type="checkbox"/> SJB3122000	 

1. Show location. Shows the location of the monitoring point on the map at a scale of 1:10,000.
2. After clicking on the icon, on the right side of the map window, a table of attributes/detailed characteristics for this monitoring point will be displayed (3).
4. Monitoring point selection field. You can select one or more monitoring points and generate a report in \*.pdf format.

To generate a report, it is necessary to scroll down the list of monitoring points to the "report" option (next figure).

The following options are available:

- selection of monitoring time frames;
- report content - select from the following criteria: description, attributes/characteristics of the facility, quantitative monitoring - chart, quantitative monitoring, qualitative monitoring - chart, qualitative monitoring.

When selecting a time period, click on the date in the "From" and "To" fields. A window will appear with the possibility of quick selection of the year and month of starting/ending research at this monitoring point.

To select a month, click on the month caption and select the required month from the table.

To select a year, click on the year and select the desired year from the list.

To define the content of the report, check or uncheck the checkboxes and click the "GENERATE REPORT" button. A \*.pdf file will be generated for selected monitoring points with information specified in the "REPORT" form.

The same report can be generated using the right panel "monitoring point information". However, in this case the generated report will concern only one monitoring point.

Period	Depth [m]	Range
2008 Q2	-0.78	2008-02 - 2008-04
2008 Q3	-1.52	2008-05 - 2008-07
2008 Q4	-1.07	2008-08 - 2008-10
2009 Q1	-0.87	2008-11 - 2009-01
2009 Q2	-1.04	2009-02 - 2009-04
2009 Q3	-1.37	2009-05 - 2009-07
2009 Q4	-1.67	2009-08 - 2009-10
2010 Q1	-0.98	2009-11 - 2010-01
2010 Q2	-1.04	2010-02 - 2010-04
2010 Q3	-1.31	2010-05 - 2010-07
2010 Q4	-1.18	2010-08 - 2010-10

information on the selected monitoring point

data on the quantitative monitoring of the selected point

"GENERATE REPORT" button for creating a report in \*.pdf format. You can specify the content of the report from the specified criteria.

## Features available for logged in users

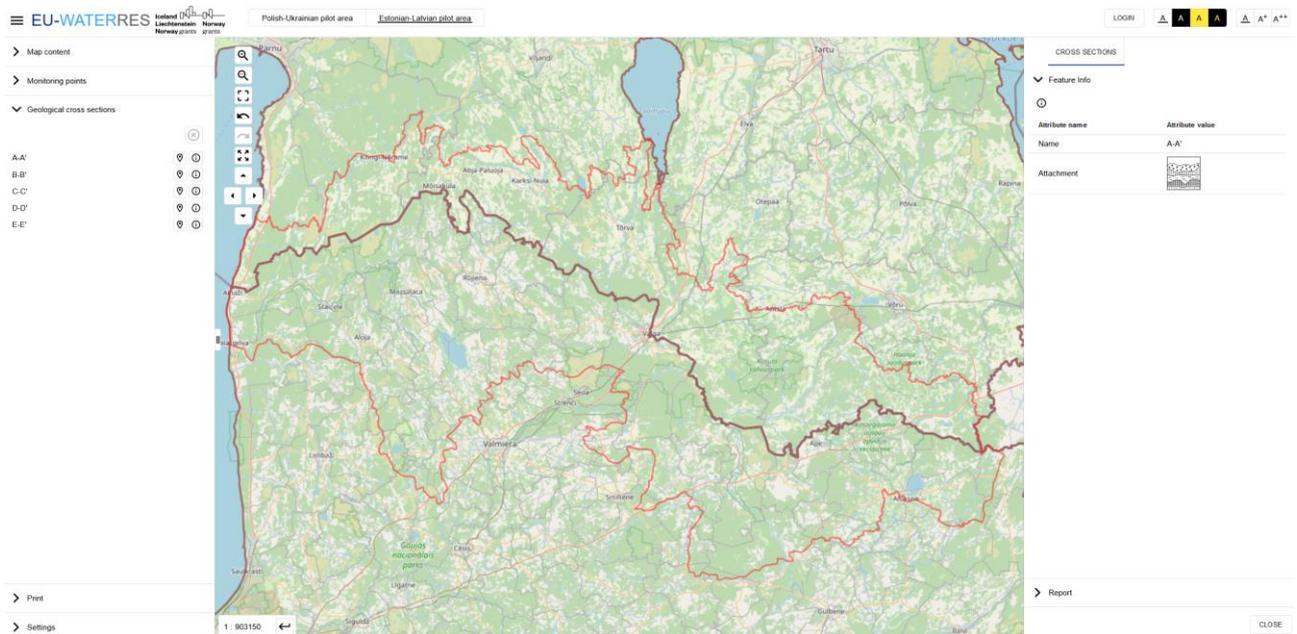

This feature is only available to logged in users. It allows you to import data from quantitative or qualitative monitoring for points that are in the database. The data must be prepared in \*.csv files with a fixed structure. During import, the data already existing in the database for a given point are updated with data from the \*.csv file.

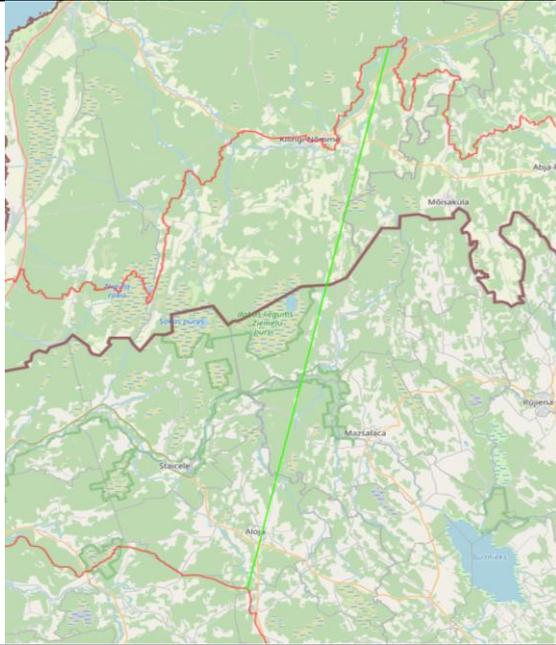

## 6. Viewing data in the "Geological cross sections" tab

In this tab you will find information on the geological structure along the given cross-section lines. After expanding the "Geological cross sections" tab, a list of profile lines will appear:

<p>Geological cross sections</p>			- shows the course of the profile line on the map
A-A'	 		- displays "layer information" for a given profile line on the right side of the map window
B-B'	 		
C-C'	 		
D-D'	 		- closes the given profile line
E-E'	 		

General view of the window with the selected profile line selected:

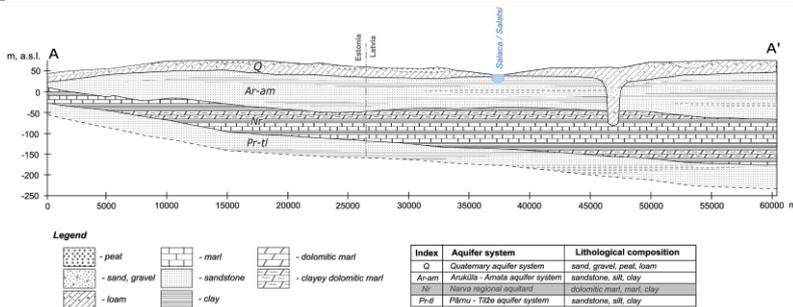

After clicking the icon next to the section line, it appears at maximum scale for full preview

Attribute name	Attribute value
Name	AA''
Length (km)	189.03
Cross section	

Displays profile line attributes on the right side of the map

The "cross section" icon generates the entire cross-section in \*jpg format, which appears in a new browser tab (see image below)

Geological section in \*jpg format

Button to generate a map in \*.pdf format

The blue rectangle defines the printing area.

Increasing or decreasing the print area is done by changing the scale in the print window.

The print area (blue rectangle) can be moved around the map with the mouse.

## 8. List of thematic layers & authors

<b>Thematic layer</b>	<b>Estonian authors</b>	<b>Latvian authors</b>
Hydrogeological units of the main useful aquifer	Magdaleena Männik, Liina Hints, Marlen Hunt	Jānis Bikše
Depth to the main useful aquifer	Liina Hints	Jānis Bikše
Hydroisohypses of the main useful aquifer	Liina Hints	Jānis Bikše
Thickness of the impermeable layer over main useful aquifer	Magdaleena Männik	Jānis Bikše
Transmissivity of the main useful aquifer	Marlen Hunt	Dāvis Borozdins, Jekaterina Demidko, Krišjānis Valters
Springs		Jānis Bikše
Thickness of the main useful aquifer	Liina Hints	Dāvis Borozdins, Jekaterina Demidko, Krišjānis Valters
Wells / Boreholes	Magdaleena Männik, Liina Hints, Marlen Hunt	Dāvis Borozdins, Jekaterina Demidko, Krišjānis Valters
Intakes	Magdaleena Männik, Liina Hints, Marlen Hunt	Krišjānis Valters
Buried valleys	Magdaleena Männik	Jānis Bikše
Areas of depression cones	Marlen Hunt	-
Groundwater bodies	Magdaleena Männik, Liina Hints, Marlen Hunt	Dāvis Borozdins, Jekaterina Demidko, Krišjānis Valters
Groundwater pollution sites	Magdaleena Männik, Liina Hints, Marlen Hunt	Dāvis Borozdins
Vulnerability to groundwater pollution	Magdaleena Männik	Jekaterina Demidko
Groundwater monitoring points	Magdaleena Männik, Liina Hints, Marlen Hunt	Jekaterina Demidko
Groundwater mineralization for main useful aquifer	Liina Hints	Dāvis Borozdins, Jekaterina Demidko, Krišjānis Valters
Pollution risk of the Quaternary aquifer	Magdaleena Männik	Dāvis Borozdins, Jekaterina Demidko, Krišjānis Valters
Pollution risk of the main useful aquifer	Magdaleena Männik	Dāvis Borozdins, Jekaterina Demidko, Krišjānis Valters
Cross sections	-	Dāvis Borozdins
